

**Designation: D4485 – 18a**

## Standard Specification for Performance of Active API Service Category Engine Oils<sup>1</sup>

This standard is issued under the fixed designation D4485; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

*This standard has been approved for use by agencies of the U.S. Department of Defense.*

### INTRODUCTION

This specification covers all the currently active American Petroleum Institute (API) engine oil performance categories that have been defined in accordance with the ASTM consensus process. There are organizations with specifications not subject to the ASTM consensus process, such as the International Lubricant Standardization and Approval Committee (ILSAC), American Petroleum Institute (API – SM, SN Specifications), and the Association des Constructeurs Européens d'Automobiles (ACEA). Certain of these specifications, which have been defined primarily by the use of current ASTM test methods, have also been included in the Appendixes for information.

In the ASTM system, a specific API designation is assigned to each category. The system is open-ended, that is, new designations are assigned for use with new categories as each new set of oil performance characteristics are defined. Oil categories may be referenced by engine builders in making lubricant recommendations, and used by lubricant suppliers and customers in identifying products for specific applications. Where applicable, candidate oil programs are conducted in accordance with the American Chemistry Council (ACC) Petroleum Additives Product Approval Code of Practice.

Other service categories not shown in this document have historically been used to describe engine oil performance (SA, SB, SC, SD, SE, SF, SG, SH and CA, CB, CC, CD, CD-II, CE, CF, CF-2, CF-4, CG-4) (see 3.1.2). SA is not included because it does not have specified engine performance requirements. SH is not included because it was a category that could not be licensed for gasoline engine oil use in the API Service Symbol after Dec. 2, 2010. (Note—The SH category has been included in **Appendix X8** as relevant information in combination with “C” categories.) The others are not included because they are based on test methods for which engine parts, test fuel, or reference oils, or a combination thereof, are no longer available. Also, the ASTM 5-Car and Sequence VI Procedures are obsolete and have been deleted from the category Energy Conserving and Energy Conserving II (defined by Sequence VI). Information on excluded older categories and obsolete test requirements can be found in SAE J183.

### 1. Scope\*

1.1 This specification covers engine oils for light-duty and heavy-duty internal combustion engines used under a variety of operating conditions in automobiles, trucks, vans, buses, and off-highway farm, industrial, and construction equipment.

<sup>1</sup> This specification is under the jurisdiction of ASTM Committee D02 on Petroleum Products, Liquid Fuels, and Lubricants and is the direct responsibility of Subcommittee D02.B0 on Automotive Lubricants.

Current edition approved Oct. 1, 2018. Published October 2018. Originally approved in 1985. Last previous edition approved in 2018 as D4485 – 18. DOI: 10.1520/D4485-18A.

1.2 This specification is not intended to cover engine oil applications such as outboard motors, snowmobiles, lawn mowers, motorcycles, railroad locomotives, or oceangoing vessels.

1.3 This specification is based on engine test results that generally have been correlated with results obtained on reference oils in actual service engines operating with gasoline or diesel fuel. As it pertains to the API SL engine oil category, it is based on engine test results that generally have been correlated with results obtained on reference oils run in gasoline engine Sequence Tests that defined engine oil categories prior to 2000. It should be recognized that not all aspects

**\*A Summary of Changes section appears at the end of this standard**

of engine oil performance are evaluated by the engine tests in this specification. In addition, when assessing oil performance, it is desirable that the oil be evaluated under actual operating conditions.

1.4 This specification includes bench and chemical tests that help evaluate some aspects of engine oil performance not covered by the engine tests in this specification.

1.5 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

#### 1.5.1 *Exceptions:*

1.5.1.1 The roller follower shaft wear in Test Method **D5966** is in mils.

1.5.1.2 The oil consumption in Test Method **D6750** is in grams per kilowatthour.

NOTE 1—The kWh unit is deprecated. The preferred SI unit is the joule (J); 1 kWh = 3.6 MJ.

1.5.1.3 The bearing wear in Test Method **D6709** is in grams and is described as weight loss, a non-SI term.

1.5.1.4 Some of the appendixes are verbatim from other sources, and non-SI units are included.

1.6 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

### 3. Terminology

#### 3.1 Definitions:

3.1.1 *automotive, adj*—descriptive of equipment associated with self-propelled machinery, usually vehicles driven by internal combustion engines.

3.1.2 *category, n*—in engine oils, a designation such as SJ, SL, SM, SN, CH-4, CI-4, CJ-4, CK-4, FA-4, Energy Conserving, Resource Conserving, and so forth, for a given level of performance in specified engine and bench tests.

3.1.3 *classification, n*—in engine oils, the systematic arrangement into categories in accordance with different levels of performance in specified engine and bench tests.

3.1.4 *heavy duty, adj*—in internal combustion engine operation, characterized by average speeds, power output, and internal temperatures that are generally close to the potential maximums.

3.1.5 *heavy-duty engine, n*—in internal combustion engine types, one that is designed to allow operation continuous at or close to its peak output.

3.1.6 *light-duty, adj*—in internal combustion engine operation, characterized by average speeds, power output, and internal temperatures that are generally much lower than the potential maximums.

3.1.7 *light-duty engine, n*—in internal combustion engine types, one that is designed to be normally operated at substantially less than its peak output.

3.1.7.1 *Discussion*—This type of engine is typically installed in automobiles and small trucks, vans, and buses.

3.1.8 *lugging, adj*—in internal combustion engine operation, characterized by a combined mode of relatively low-speed and high-power output.

#### 3.2 Definitions of Terms Specific to This Standard:

3.2.1 *C category, n*—the group of engine oils that are intended primarily for use in diesel and certain gasoline-powered vehicles.

3.2.2 *Energy Conserving category, n*—the group of engine oils that have demonstrated fuel economy benefits and are intended primarily for use in automotive gasoline engine applications, such as passenger cars, light-duty trucks, and vans.

3.2.3 *engine oil, n*—a lubricating liquid with additives that reduces friction or wear, or both, between the moving parts within an engine; removes heat, serves as a combustion-gas sealant for piston rings; and reduces potentially harmful effects such as rusting, deposit formation, oil oxidation, and foaming resulting from engine operation.

3.2.4 *F category, n*—a group of heavy duty engine oils specified to help meet greenhouse gas (GHG) emission legislation, for example, legislation first introduced on 2017 model year engines.

3.2.5 *S category, n*—the group of engine oils that are intended primarily for use in automotive gasoline engine applications, such as passenger cars, light-duty trucks, and vans.

### 4. Performance Classification

4.1 Automotive engine oils are classified in three general arrangements, as defined in 3.2; that is, S, C, and Energy Conserving. These arrangements are further divided into categories with performance measured as follows:

4.1.1 *SJ*—Oil meeting the performance requirements measured in the following gasoline engine tests and bench tests:

4.1.1.1 Test Method **D5844**, the Sequence IID, gasoline engine test has been correlated with vehicles used in short-trip service prior to 1978,<sup>5,8</sup> particularly with regard to rusting. (An alternative is Test Method **D6557**, the Ball Rust Test.)

4.1.1.2 Test Method **D5533**, the Sequence IIIE gasoline engine test, has been correlated with vehicles used in high-temperature service prior to 1988,<sup>9</sup> particularly with regard to oil thickening and valve train wear. (Alternatives are Test Method **D6984**, the Sequence IIIF test, or Test Method **D7320**, the Sequence IIIG test.)

4.1.1.3 Test Method **D5302**, the Sequence VE gasoline engine test, has been correlated with vehicles used in stop-and-go service prior to 1988,<sup>10</sup> particularly with regard to sludge and valve train wear. (An alternative is the combination of Test Method **D6593**, the Sequence VG test, and Test Method **D6891**, the Sequence IVA test.)

4.1.1.4 Test Method **D5119**, the L-38 gasoline engine test, is used to measure copper-lead bearing weight loss under high-temperature operating conditions. (An alternative is Test Method **D6709**, the Sequence VIII test.)

(1) Test Method **D5119** (or Test Method **D6709**) is also used to determine the ability of an oil to resist permanent viscosity loss due to shearing in an engine.

4.1.1.5 In addition to passing performance in the engine tests, specific viscosity grades shall also meet bench test requirements (see **Table 1**), which are discussed in the following subsections:

(1) The volatility of engine oils is one of several factors that relates to engine oil consumption.

(2) Test Method **D6795**, the EOFT screens for the formation of precipitates and gels that form in the presence of water and can cause oil filter plugging.

(3) Phosphorus compounds in excessive amounts can cause glazing of automotive catalysts and exhaust gas oxygen sensors

**TABLE 1 S Engine Oil Categories**

	API SJ Category				
Required Test Method	Engine Test Method	Rated or Measured Parameter		Primary Performance Criteria	
Sequence IID (D5844 <sup>A,B</sup> ) or D6557 <sup>A</sup> (Ball Rust Test)	D5844	Average engine rust rating, <sup>C</sup> min		8.5	
		Number stuck lifters		none	
	D6557	Average gray value, min		100	
Sequence IIIE (D5533 <sup>B,D</sup> ) or Sequence IIIF (D6984 <sup>D</sup> ) or Sequence IIIG (D7320 <sup>J</sup> )	D5533	Hours to 375 % kinematic viscosity increase at 40 °C, min		64	
		Average engine sludge rating, <sup>C</sup> min		9.2	
		Average piston skirt varnish rating, <sup>C</sup> min		8.9	
		Average oil ring land deposit rating, <sup>C</sup> min		3.5	
		Lifter sticking		none	
		Scuffing and wear			
		Cam or lifter scuffing		none	
		Cam plus lifter wear, μm	Average, max	30	
			Maximum, max	64	
		D6984	Ring sticking (oil-related) <sup>E</sup>		none
	Kinematic viscosity, % increase at 40 °C, max		325 <sup>F</sup>		
	Average piston skirt varnish rating, <sup>C</sup> min		8.5 <sup>G</sup>		
	Weighted piston deposit rating, <sup>H</sup> min		3.2 <sup>G</sup>		
	Screened average cam-plus-lifter wear, μm, max		20 <sup>G,I</sup>		
	Hot stuck rings		none <sup>G</sup>		
	D7320	Kinematic viscosity, % increase at 40 °C, max		150	
		Weighted piston deposit rating, <sup>K</sup> min		3.5	
		Cam-plus-lifter wear avg, μm, max		60	
		Hot stuck rings		none	
		Average engine sludge rating, <sup>C</sup> min		9.0	
Rocker arm cover sludge rating, <sup>C</sup> min		7.0			
Sequence VE (D5302 <sup>B,L</sup> ) or Sequence IVA (D6891 <sup>L</sup> ) plus Sequence VG (D6593 <sup>L</sup> )	D5302	Average piston skirt varnish rating, <sup>C</sup> min		6.5	
		Average engine varnish rating, <sup>C</sup> min		5.0	
		Oil ring clogging, %		report	
		Oil screen clogging, %, max		20.0	
		Compression ring sticking (hot stuck)		none	
		Cam wear, μm	Average, max	127	
			Maximum, max	380	
		D6891	Average cam wear, μm <sup>M</sup>		120
			Average engine sludge rating, <sup>C</sup> min		7.8
		D6593	Rocker arm cover sludge rating, <sup>C</sup> min		8.0
	Average piston skirt varnish rating, <sup>C</sup> min		7.5		
	Average engine varnish rating, <sup>N</sup> min		8.9		
	Oil screen clogging, %, max		20		
	Hot stuck compression rings		none		
	L-38 (D5119 <sup>O</sup> ) or Seceque VIII (D6709 <sup>O</sup> )	D5119	Bearing weight loss, mg, max		40
			Shear stability		<sup>P</sup>
		D6709	Bearing weight loss, mg, max		26.4
Shear stability			<sup>P</sup>		

Bench Test and Measured Parameter	Viscosity Grade Performance Criteria		
	SAE 0W-20, SAE 5W-20, SAE 5W-30, SAE 10W-30	All Others	
Test Method D4683, D4741, D5481, high temperature/high shear viscosity @ 150 °C, mPa.s, min	<sup>Q</sup>	2.6	
Test Method D5800 volatility loss, % max <sup>R</sup>	22	20 <sup>S</sup>	
Test Method D6417 volatility loss at 371 °C, % max <sup>R</sup>	17	15 <sup>S</sup>	
Test Method D5480 volatility loss at 371 °C, % max <sup>R</sup>	17	15 <sup>S</sup>	
Test Method D6795 (EOFT), % flow reduction, max	50	50	
Test Method D6794 (EOWTT), % flow reduction, max	with 0.6 % H <sub>2</sub> O	report	report
	with 1.0 % H <sub>2</sub> O	report	report
	with 2.0 % H <sub>2</sub> O	report	report
	with 3.0 % H <sub>2</sub> O	report	report
Test Method D4951 or D5185, mass fraction phosphorus, %, max	0.10 <sup>T</sup>	NR <sup>U</sup>	
Test Method D4951 or D5185, mass fraction phosphorus, %, min (unless valid passing Test Method D5302 results are obtained)	0.06	0.06	
Test Method D92 flash point, °C, min <sup>V</sup>	200	NR <sup>U</sup>	
Test Method D93 flash point, °C, min <sup>V</sup>	185	NR <sup>U</sup>	
Test Method D892 foaming tendency (Option A)	Sequence I, max, foaming/settling <sup>W</sup>	10/0	10/0
	Sequence II, max, foaming/settling <sup>W</sup>	50/0	50/0
	Sequence III, max, foaming/settling <sup>W</sup>	10/0	10/0
Test Method D6082 (optional blending required) Static foam, max, tendency/stability		200/50 <sup>X</sup>	200/50 <sup>X</sup>
Test Method D6922 homogeneity and miscibility		Y	Y
Test Method D6335 High temperature deposits (TEOST 33), deposit mass, mg, max		60	60
Test Method D5133 Gelation Index, max		12	NR <sup>U</sup>

API SL Category			
Required Test Method	Engine Test Method	Rated or Measured Parameter	Primary Performance Criteria
Sequence IIIF (D6984) or Sequence IIIG (D7320 <sup>J</sup> )	D6984	Kinematic viscosity, % increase at 40 °C, max	275
		Average piston skirt varnish rating, <sup>C</sup> min	9.0
		Weighted piston deposit rating, <sup>H</sup> min	4.0
		Screened average cam-plus-lifter wear, µm, max	20 <sup>I</sup>
		Hot Stuck Rings	none
	D7320	Low temperature viscosity performance <sup>Z</sup>	report
		Kinematic viscosity, % increase at 40 °C, max	150
		Weighted piston deposit rating, <sup>K</sup> min	3.5
		Cam-plus-lifter wear avg, µm, max	60
		Hot stuck rings	none
Sequence IVA (D6891)	D6891	Low temperature viscosity performance <sup>AA</sup>	report
Sequence VE (D5302 <sup>AB,J</sup> )	D5302	Cam wear average, µm, <sup>M</sup> max	120
		Cam wear average, µm, max	127
		Cam wear max, µm, max	380
Sequence VG (D6593)	D6593	Average engine sludge rating, <sup>C</sup> min	7.8
		Rocker arm cover sludge rating, <sup>C</sup> min	8.0
		Average piston skirt varnish rating, <sup>C</sup> min	7.5
		Average engine varnish rating, <sup>N</sup> min	8.9
		Oil screen clogging, %, max	20
		Hot stuck Compression rings	none
		Cold stuck rings	report
		Oil screen debris, %	report
		Oil ring clogging, %	report
		Bearing weight loss, mg, max	26.4
Sequence VIII (D6709)	D6709	Shear stability	<sup>P</sup>

Bench Test and Measured Parameter		Viscosity Grade Performance Criteria	
		SAE 0W-20 SAE 5W-20 SAE 5W-30 SAE 10W-30	All Others
Test Method D4683, D4741, or D5481, high temperature/high shear viscosity @ 150 °C, mPa·s, min		<sup>Q</sup>	2.6
Test Method D6557 (Ball Rust Test), average gray value, min		100	100
Test Method D5800 volatility loss, % max		15	15
Test Method D6417 volatility loss at 371 °C, % max		10	10
D6795 (EOFT), % flow reduction, max		50	50
D6794 (EOWTT), % flow reduction, max	With 0.6 % H <sub>2</sub> O	50	50
	With 1.0 % H <sub>2</sub> O	50	50
	With 2.0 % H <sub>2</sub> O	50	50
	With 3.0 % H <sub>2</sub> O	50	50
Test Method D4951 or D5185, mass fraction phosphorus %, max		0.10 <sup>T</sup>	NR <sup>U</sup>
Test Method D4951 or D5185, mass fraction phosphorus %, min (unless valid passing Test Method D5302 results are obtained) <sup>J</sup>		0.06	0.06
Test Method D892 foaming tendency (Option A)	Sequence I, max, foaming/settling <sup>W</sup>	10/0	10/0
	Sequence II, max, foaming/settling <sup>W</sup>	50/0	50/0
	Sequence III, max, foaming/settling <sup>W</sup>	10/0	10/0
Test Method D6082 (optional blending required) static foam max, tendency/stability		100/0 <sup>X</sup>	100/0 <sup>X</sup>
Test Method D6922 homogeneity and miscibility		Y	Y
Test Method D7097 high temperature deposits (TEOST MHT-4), deposit mass, mg, max		45	45
Test Method D5133 (Gelation Index), max <sup>AC</sup>		12 <sup>AD</sup>	12 <sup>AD</sup>

<sup>A</sup> Demonstrate passing performance in either Test Method D5844 or D6557.

<sup>B</sup> Monitoring of this test method was discontinued in June 20, 2001. Valid test results shall predate the end of the last calibration period for the test stand in which this test method was conducted.

<sup>C</sup> ASTM Deposit Rating Manual 20, available from ASTM Customer Relations, ASTM International, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959.

<sup>D</sup> Demonstrate passing performance in either Test Method D5533 or D6984. However, an oil passing Test Method D6984 and containing less than 0.08 % mass phosphorus in the form of ZDDP shall also pass the wear limits in Test Method D5302 (see also footnote <sup>J</sup>).

<sup>E</sup> An oil-related stuck ring occurs on a piston with an individual oil ring land deposit rating <2.6.

<sup>F</sup> Determine at 60 h.

<sup>G</sup> Determine at 80 h.

<sup>H</sup> Determine weighted piston deposits by rating the following piston areas and applying the corresponding weightings: undercrown, 10 %; second land, 15 %; third land, 30 %; piston skirt, 10 %; first groove, 5 %; second groove, 10 %; and third groove, 20 %. Use ASTM Deposit Rating Manual 20 for all ratings.

<sup>I</sup> Calculate by eliminating the highest and lowest cam-plus-lifter wear results and then calculating an average based on the remaining ten rating positions.

<sup>J</sup> For oils containing at least 0.06 % mass phosphorus in the form of ZDDP, demonstrating passing performance in the Sequence IIIG test obviates the need to also conduct Test Method D5302 (Sequence VE), which was previously required for oils with less than 0.08 % mass phosphorus.

<sup>K</sup> Unlike the Sequence IIIF test, piston skirt varnish rating is not required in the Sequence IIIG test.

<sup>L</sup> Demonstrate passing performance in Test Method D5302, or alternatively, in both Test Method D6891 and Test Method D6593.

<sup>M</sup> Determine cam wear according to Test Method D6891. Seven wear measurements are made on each cam lobe and the seven measured values are added to obtain an individual cam lobe wear result. The overall cam wear value is the average of the twelve individual cam lobe wear results.

<sup>N</sup> Determine the average engine varnish rating by averaging the piston skirt, right rocker arm cover, and left rocker arm cover varnish ratings. Use ASTM Deposit Rating Manual 20 for all ratings.

<sup>O</sup> Demonstrate passing performance in either Test Method D5119 or D6709.

<sup>P</sup> Ten-hour stripped kinematic viscosity (oil shall remain in original viscosity grade).

<sup>Q</sup> Minimum high temperature/high shear viscosity @ 150 °C for these viscosity grades as defined in SAE J300.

<sup>R</sup> Meet the volatility requirement in either Test Method D5800, D5480, or D6417.

<sup>S</sup> Passing volatility loss only required for SAE 15W-40 oils.

<sup>T</sup> This is a noncritical specification as described in Practice D3244.

<sup>U</sup> NR stands for Not Required.

<sup>V</sup> Meet either Test Method D92 or Test Method D93 flash point requirement.

<sup>W</sup> Determine settling volume, in mL, at 10 min.

<sup>X</sup> Determine settling volume, in mL, at 1 min.

<sup>Y</sup> Homogeneous with SAE reference oils.

<sup>Z</sup> Evaluate the 80 h test oil sample by Test Method D4684 at the temperature indicated by the low temperature grade of oil as determined on the 80 h sample by Test Method D5293.

<sup>AA</sup> Measure the viscosity of the EOT oil sample by Test Method D4684. The measured viscosity shall meet the requirements of the original grade or the next higher grade. The EOT sample can be either from a Sequence IIIG or a Sequence IIIGA test. (A Sequence IIIGA test is identical to a Sequence IIIG test, except only low temperature viscosity performance is measured.) Additional details are provided in the Sequence IIIG test method, in Section 13.6.

<sup>AB</sup> Not required for oils containing a minimum of 0.08 % mass phosphorus in the form of ZDDP.

<sup>AC</sup> Requirement applies only to SAE 0W-20, 5W-20, 0W-30, 5W-30, and 10W-30 viscosity grades.

<sup>AD</sup> For gelation temperatures at or above the W grade pumpability temperature as defined in SAE J300.

and, thereby, deactivate them. Control of the phosphorus level in the engine oil may reduce this tendency.

(4) The flash point may indicate if residual solvents and low-boiling fractions remain in the finished oil.

(5) Excessive foaming in engine oil can cause valve lifter collapse and a loss of lubrication due to the presence of air in the oil. Test Methods D892 and D6082 empirically rate the foaming tendency and stability of oils.

(6) Test Method D6922, the H and M Test indicates the compatibility of an oil with standard test oils.

(7) Newer engines designed to provide increased power and improved driveability and to meet future federal emissions and fuel economy requirements may be sensitive to internal deposits caused by elevated engine operating temperatures. Test Method D6335, the TEOST test, may be useful in determining the deposit control of oils recommended for these engines.

(8) Test Method D5133, the Gelation Index technique, might identify oils susceptible to air binding and might provide low temperature protection not adequately measured by the Test Method D4684.

4.1.1.6 Licensing of the API SJ category by the American Petroleum Institute (API) requires that candidate oils meet the performance requirements in this specification, and that the oils be tested in accordance with the protocols described in the ACC Petroleum Additives Product Approval Code of Practice. The methodology detailed in the ACC Code will help ensure that an engine oil meets its intended performance specification. (See Appendix X3 for more information.)

4.1.2 *SL*—Oil meeting the performance requirements measured in the following gasoline engine tests and bench tests:

4.1.2.1 Test Method D6984, the Sequence IIIF gasoline engine test, is used to measure oil thickening and piston deposits under high temperature conditions and provides information about valve train wear.<sup>11</sup> (An alternative is Test Method D7320, the Sequence IIIG test.)

4.1.2.2 Test Method D6891, the Sequence IVA gasoline engine test, has been correlated with the Sequence VE gasoline engine test in terms of overhead cam and slider follower wear control.<sup>8</sup>

4.1.2.3 Test Method D5302, the Sequence VE gasoline engine test, has been correlated with vehicles used in stop-and-go service prior to 1988, with regard to valve train wear. It is included in the SL performance specification to augment assessment of the wear control performance of oils containing less than 0.08 % mass of phosphorus from ZDDP additive.

NOTE 2—Prior to May 2004, the API SH, SJ, and SL categories required that oils with passing Test Method D6984 (Sequence IIIF) results, and containing less than 0.08 % mass phosphorus in the form of ZDDP, also demonstrate passing performance in Test Method D5302 (Sequence VE). This requirement was included to address concerns over adequate wear protection with low levels of ZDDP. However, Test Method D5302 has not been available to industry for some time, and an alternative method was needed. In a related activity, the next level of gasoline engine oil performance, the ILSAC GF-4 standard, was developed outside the normal ASTM consensus process. Deliberations during the GF-4 development process included careful consideration of the suitability of Test Method D7320, the Sequence IIIG, a new test, to evaluate the wear protection of oils with less than 0.08 % mass phosphorus. Data on oils with less than 0.08 % mass phosphorus in the form of ZDDP were reviewed by members of the D02.B0 Passenger Car Engine Oil Classification Panel (PCEOCP). These data were from Test Method D7320 (Sequence IIIG) tests and from field tests on large populations of older vehicles with different engine types. Based on these data, the PCEOCP recommended a ballot to allow the use of Test Method D7320 (Sequence IIIG) as an alternative to Test Method D6984 (Sequence IIIF) plus Test Method D5302 (Sequence VE) for demonstration of acceptable API SH, SJ, and SL performance on low phosphorus oils, establishing at least the mass fraction of phosphorus is 0.06 % as the minimum level. That ballot was approved by Subcommittee D02.B0 in May 2004.

4.1.2.4 Test Method D6593, the Sequence VG gasoline engine test, has been correlated with the Sequence VE gasoline engine test and with vehicles used in stop-and-go service prior to 2000, with regard to sludge and varnish deposit control.

4.1.2.5 Test Method D6709, the Sequence VIII gasoline engine test, is used to measure copper-lead bearing weight loss under high-temperature operating conditions and has been shown to correlate with the L-38 gasoline engine test.<sup>9</sup>

(1) The Sequence VIII gasoline engine test is also used to determine the ability of an oil to resist permanent viscosity loss due to shearing in an engine.

4.1.2.6 In addition to passing performance in the engine tests, oils shall also meet bench test requirements (see Table 1), which are discussed in the following subsections:

(1) Test Method D6557 (Ball Rust Test), was developed to replace the Sequence IID gasoline engine test, and evaluates the ability of an oil to prevent the formation of rust under short-trip service conditions.

<sup>11</sup> Supporting data have been filed at ASTM International Headquarters and may be obtained by requesting Research Report RR:D02-1391. Contact ASTM Customer Service at service@astm.org.

(2) The volatility of engine oils is one of several factors that relates to engine oil consumption. For this engine oil category, volatility is measured by Test Methods **D5800** and **D6417**.

(3) Test Method **D6795**, the Engine Oil Filterability Test (EOFT) and Test Method **D6794**, the Engine Oil Water Tolerance Test (EOWTT) screen for the formation of precipitates and gels which form in the presence of water and can cause oil filter plugging.

(4) Phosphorus compounds in excessive amounts can cause glazing of automotive catalysts and exhaust gas oxygen sensors and, thereby, deactivate them. Control of the phosphorus level in the engine oil may reduce this tendency. For this engine oil category, phosphorus content is measured by either Test Method **D4951** or **D5185**.

(5) Excessive foaming in engine oil can cause valve lifter collapse and a loss of lubrication due to the presence of air in the oil. Test Methods **D892** and **D6082** empirically rate the foaming tendency and stability of oils.

(6) Test Method **D6922**, the H and M Test indicates the compatibility of an oil with standard test oils.

(7) Newer engines designed to provide increased power and improved driveability and to meet future federal emissions and fuel economy requirements may be sensitive to internal deposits caused by elevated engine operating temperatures. Test Method **D7097**, the TEOST MHT-4 test may be useful in determining the piston deposit control capability of oils recommended for these engines.

(8) Test Method **D5133**, the Gelation Index technique, might identify oils susceptible to air binding and might provide low-temperature protection not adequately measured by Test Method **D4684**.

4.1.2.7 Licensing of the API SL category by the American Petroleum Institute (API) requires that candidate oils meet the performance requirements in this specification, and that the oils be tested in accordance with the protocols described in the ACC Petroleum Additives Product Approval Code of Practice. The methodology detailed in the ACC Code will help ensure that an engine oil meets its intended performance specification. (See **Appendix X3** for more information.)

4.1.3 *CH-4*—Oil meeting the performance requirements measured in the following diesel and gasoline engine tests and bench tests.

4.1.3.1 Test Method **D6750**, the 1K diesel engine test, has been correlated with vehicles equipped with engines used in high speed operation prior to 1989, particularly with respect to aluminum piston deposits and oil consumption when the mass fraction of sulfur content is nominally 0.4 %.<sup>10</sup>

4.1.3.2 Test Method **D6681**, the 1P diesel engine test, has been used to predict iron piston deposit formation and oil consumption in four-stroke-cycle, direct injection, diesel engines that have been calibrated to meet 1998 U.S. federal

exhaust emissions requirements for heavy duty engines operated on fuel containing the mass fraction of sulfur less than 0.05 %.<sup>12</sup>

4.1.3.3 Test Method **D6483**, the T-9 diesel engine test, has been correlated with vehicles equipped with engines used in high speed operation prior to 1998, particularly in regard to ring and liner wear and used oil lead content.<sup>13</sup> (Alternatives are Test Method **D6987/D6987M**, the T-10 diesel engine test—see 4.1.4.2, and Test Method **D7422**, the T-12 diesel engine test—see 4.1.3.2.)

4.1.3.4 Test Method **D5967** extended, the T-8E engine test, has been shown to generate soot-related oil thickening in a manner similar to 1998 emissions-controlled heavy duty diesel engines using electronic injection control systems.

4.1.3.5 Test Method **D6838**, The M11 High Soot diesel engine test has been correlated with vehicles equipped with four-stroke-cycle diesel engines used in high speed operations prior to 1998, particularly with regard to soot related valve train wear, filter plugging, and sludge control.<sup>14</sup> (An alternative is Test Method **D7468**, the Cummins ISM diesel engine test. See 4.1.5.5.)

4.1.3.6 Test Method **D5966**, the Roller Follower Wear Test, has been correlated with hydraulic roller cam follower pin wear in medium-duty indirect injection diesel engines used in broadly based field operations.

4.1.3.7 Test Method **D6984**, the Sequence IIIF test, is used to measure bulk oil viscosity increase, which indicates an oil's ability to withstand the higher temperatures found in modern diesel engines. (An alternative is Test Method **D7320**, the Sequence IIIG test.)

4.1.3.8 Test Method **D6894**, the EOAT has been correlated with oil aeration in diesel engines equipped with HEUI used in medium-duty diesel engines.<sup>15</sup>

4.1.3.9 Test Method **D892**, a foaming test, Sequences I, II and III, has been shown to predict foaming of engine oils in diesel engines.

4.1.3.10 Test Method **D6594** operated at 135 °C, a High Temperature Corrosion Bench Test (HTCBT), has been shown to predict the corrosion of engine oil-lubricated copper and lead containing components used in diesel engines.

4.1.3.11 Test Method **D6278**, the Diesel Injector Shear Test, has been shown to correlate with permanent shear loss of engine oils in medium-duty direct injection diesel engines used in broadly based field operations.

4.1.3.12 Test Method **D5800**, Noack Volatility or, alternatively, Test Method **D6417**, are used to measure engine oil volatility loss under high temperature operating conditions.

<sup>12</sup> Supporting data have been filed at ASTM International Headquarters and may be obtained by requesting Research Report RR:D02-1441. Contact ASTM Customer Service at service@astm.org.

<sup>13</sup> Supporting data have been filed at ASTM International Headquarters and may be obtained by requesting Research Report RR:D02-1440. Contact ASTM Customer Service at service@astm.org.

4.1.3.13 Licensing of the API CH-4 category by the American Petroleum Institute (API) requires that candidate oils meet the performance requirements in this specification, and that the oils be tested in accordance with the protocols described in the ACC Petroleum Additives Product Approval Code of Practice. The methodology detailed in the ACC Code will help ensure that an engine oil meets its intended performance specification. (See [Appendix X3](#) for more information.)

4.1.4 *CI-4*—Oil meeting the performance requirements measured in the following diesel and gasoline engine tests and bench tests.

4.1.4.1 Test Method [D6923](#), the 1R single cylinder diesel engine test is used to measure engine oil performance with respect to piston deposits, oil consumption, piston and piston ring scuffing, and ring sticking using a two-piece iron/aluminum piston similar to that used in modern, production heavy-duty diesel engines. (An alternative is Test Method [D6681](#), the 1P diesel engine test, see [4.1.3.2](#).)

4.1.4.2 Test Method [D6987/D6987M](#), the T-10 diesel engine test, is used to measure engine oil performance with respect to piston ring and cylinder liner wear, bearing lead corrosion, and oil consumption in an electronically governed, open chamber, in-line six-cylinder, four-stroke cycle, turbocharged, compression-ignition engine with exhaust gas recirculation. (An alternative is Test Method [D7422](#), the T-12 diesel engine test, see [4.1.5.2](#).)

4.1.4.3 Test Method [D6975](#), the M11 EGR heavy-duty diesel engine test, is used to evaluate oil performance with respect to valve train wear, sludge deposits, and oil filter plugging in an exhaust gas recirculation environment. (An alternative is the Cummins ISM diesel engine test. See [4.1.5.5](#).)

4.1.4.4 Test Method [D5967](#) extended, the T-8E engine test, has been shown to generate soot-related oil thickening in a manner similar to 1998 emissions-controlled heavy-duty diesel engines using electronic injection control systems.

4.1.4.5 Test Method [D6984](#), the Sequence IIIF gasoline engine test, is used to measure oil thickening under high temperature conditions in spark-ignition engines. (An alternative is Test Method [D7320](#), the Sequence IIIG test.)

4.1.4.6 Test Method [D6750](#) (1K), the 1K diesel engine test, or, alternatively, Test Method [D6750](#) (1N), the 1N diesel engine test, is used to evaluate performance in diesel engines equipped with aluminum pistons. The 1K test has been correlated with vehicles used in high speed operation prior to 1989, particularly with respect to aluminum piston deposits and oil consumption, when the mass fraction of fuel sulfur was nominally 0.4 %. The 1N test has been used to predict aluminum piston deposit formation in four-stroke cycle, direct-injection, diesel engines that have been calibrated to meet 1994 U.S. federal exhaust emissions requirements for heavy-duty engines operated on fuel containing the mass fraction of sulfur less than 0.05 %.

4.1.4.7 Test Method [D5966](#), the Roller Follower Wear Test, has been correlated with hydraulic roller cam follower pin wear in medium-duty indirect injection diesel engines used in broadly based field operations.

4.1.4.8 Test Method [D6894](#), the EOAT procedure, has been correlated with oil aeration in diesel engines equipped with HEUI used in medium-duty diesel engines.

4.1.4.9 Test Methods [D4741](#), [D4683](#), and [D5481](#) High Temperature High Shear (HTHS) tests are part of the SAE J300 Viscosity Classification System.

4.1.4.10 Test Method [D4684](#) (MRV TP-1) has been shown to predict field failures resulting from poor low temperature pumpability.

4.1.4.11 Test Method [D5800](#), Noack Volatility, is used to measure engine oil volatility loss under high temperature operating conditions.

4.1.4.12 Test Method [D6594](#) operated at 135 °C, a high temperature corrosion bench test (HTCBT), has been shown to predict corrosion of engine oil-lubricated copper and lead containing components used in diesel engines.

4.1.4.13 Test Method [D6278](#), a diesel injector shear test, has been shown to correlate with permanent shear loss of engine oils in medium-duty direct injection diesel engines used in broadly based field operations.

4.1.4.14 Test Method [D892](#), a foaming test, Sequences I, II, and III, has been shown to predict foaming of engine oils in diesel engines.

4.1.4.15 Test Method [D7216](#), the Elastomer Compatibility Test is used to measure the performance of four widely used elastomer compounds when exposed to diesel engine oils.

4.1.4.16 Licensing of the API CI-4 category by the American Petroleum Institute (API) requires that candidate oils meet the performance requirements in this specification, and that the oils be tested in accordance with the protocols described in the ACC Petroleum Additives Product Approval Code of Practice. The methodology detailed in the ACC Code will help ensure that an engine oil meets its intended performance specification. (See [Appendix X3](#) for more information.)

4.1.5 *CI-4*—Oil meeting the performance requirements measured in the following diesel and gasoline engine tests, and bench and chemical tests.

4.1.5.1 Test Method [D7156](#), the Mack T-11 diesel engine test has been shown to generate soot-related oil thickening in a manner similar to 2002 EGR emission-controlled heavy-duty engines with electronic injection control. This engine test uses fuel with sulfur content of 500 mg/kg.

4.1.5.2 Test Method [D7422](#), the Mack T-12 diesel engine test is used to measure engine oil performance with respect to piston ring and cylinder liner wear, bearing corrosion, and oil consumption, using an in-line six cylinder, four-stroke, direct injection, turbo-charged engine with exhaust gas recirculation at levels expected for 2007 emission control engines. This engine test uses fuel with ultra low sulfur content of 15 mg/kg.

4.1.5.3 Test Method [D7549](#), the Caterpillar C13 *Advanced Combustion Emission Reduction Technology* (ACERT) is an in-line six-cylinder engine used to measure engine oil consumption and piston deposits. The engine is equipped with a single-piece forged steel piston used in emission controlled engines. This engine test uses fuel with ultra low sulfur content of 15 mg/kg.

4.1.5.4 Test Method [D7484](#), the Cummins ISB diesel engine test is used to evaluate oil performance with respect to cam and

tappet wear with high soot level in the engine oil. This is an in-line six cylinder turbo-charged engine with a common-rail fuel system for emission control. This engine test uses fuel with ultra low sulfur content of 15 mg/kg.

4.1.5.5 Test Method **D7468**, the Cummins ISM diesel engine test is used to evaluate oil performance with respect to valve train wear, sludge and oil filter plugging with a high soot level in the engine oil. This is an in-line six cylinder, turbo-charged engine with EGR for emission control. This engine test uses fuel with sulfur content of 500 mg/kg.

4.1.5.6 Test Method **D6750**, the 1N diesel engine test, has been used to predict piston deposit formation in four-stroke cycle, direct injection, diesel engines that have been calibrated to meet 1994 U.S. federal exhaust emissions requirements for heavy-duty engines operated on fuel containing the mass fraction of sulfur less than 0.05 %.<sup>16</sup>

4.1.5.7 Test Method **D6984**, the Sequence IIIF test, is used to measure bulk oil viscosity increase, which indicates an oil's ability to withstand the higher temperatures found in modern diesel engines. (An alternative is Test Method **D7320**, the Sequence IIIG test.)

4.1.5.8 Test Method **D5966**, the roller follower wear test (RFWT), has been correlated with hydraulic roller cam follower pin wear in medium-duty indirect injection diesel engines used in broadly based field operations.

4.1.5.9 Test Method **D4684** (MRV TP-1) has been shown to predict field failures resulting from poor low temperature pumpability.

4.1.5.10 Test Method **D7109**, a diesel injector shear test, has been shown to correlate with permanent shear loss of engine oils in medium-duty direct injection diesel engines used in broadly based field operations.

4.1.5.11 Test Method **D6594** operated at 135 °C, a high temperature corrosion bench test (HTCBT), has been shown to predict corrosion of engine oil-lubricated copper and lead containing components used in diesel engines.

4.1.5.12 Test Methods **D4171**, **D4683**, and **D5481** High Temperature High Shear (HTHS) tests are part of the SAE J300 Viscosity Classification System.

4.1.5.13 Test Method **D892**, a foaming test, Sequences I, II, and III, has been shown to predict foaming of engine oils in diesel engines.

4.1.5.14 Test Method **D7216**, the Elastomer Compatibility Test, is used to measure the performance of four widely used elastomer compounds when exposed to diesel engine oils.

4.1.5.15 Test Method **D6894**, the EOAT procedure, has been correlated with oil aeration in diesel engines equipped with HEUI used in medium-duty diesel engines.

4.1.5.16 Licensing of the API CJ-4 category by the American Petroleum Institute (API) requires that candidate oils meet the performance requirements in this specification, and that the oils be tested in accordance with the protocols described in the ACC Petroleum Additives Product Approval Code of Practice. The methodology detailed in the ACC Code will help ensure

that an engine oil meets its intended performance specification. (See **Appendix X3** for more information.)

4.1.6 **CK-4 or FA-4**—Oil meeting the performance requirements measured in the following diesel engine tests, and bench and chemical tests.

4.1.6.1 Test Method **D8048**, the Volvo T-13 diesel engine test method, is used to evaluate the oxidation resistance performance of engine oils in turbocharged and intercooled four-cycle diesel engines equipped with EGR and running on ultra-low sulfur diesel fuel.

4.1.6.2 Test Method **D8047**, the Caterpillar-C13 Engine Oil Aeration Test (COAT) method, evaluates an engine oil's resistance to aeration under high-engine-speed, zero load conditions using a direct-injection, turbocharged, after-cooled, six-cylinder diesel engine.

4.1.6.3 Test Method **D7156**, the Mack T-11 diesel engine test, has been shown to generate soot-related oil thickening in a manner similar to 2002 EGR emission-controlled heavy-duty engines with electronic injection control. This engine test uses fuel with sulfur content of 500 mg/kg.

4.1.6.4 Test Method **D7422**, the Mack T-12 diesel engine test, is used to measure engine oil performance with respect to piston ring and cylinder liner wear, using an in-line six cylinder, four-stroke, direct injection, turbo-charged engine with exhaust gas recirculation at levels expected for 2007 emission control engines. This engine test uses fuel with ultra low sulfur content of 15 mg/kg.

4.1.6.5 Test Method **D7549**, the Caterpillar C13 Advanced Combustion Emission Reduction Technology (ACERT) is an in-line six-cylinder engine used to measure engine oil consumption and piston deposits. The engine is equipped with a single-piece forged steel piston used in emission controlled engines. This engine test uses fuel with ultra low sulfur content of 15 mg/kg

4.1.6.6 Test Method **D7484**, the Cummins ISB diesel engine test, is used to evaluate oil performance with respect to cam and tappet wear with high soot level in the engine oil. This is an inline six cylinder turbo-charged engine with a common-rail fuel system for emission control. This engine test uses fuel with ultra low sulfur content of 15 mg/kg.

4.1.6.7 Test Method **D7468**, the Cummins ISM diesel engine test, is used to evaluate oil performance with respect to valve train wear, sludge and oil filter plugging with a high soot level in the engine oil. This is an in-line six cylinder, turbo-charged engine with EGR for emission control. This engine test uses fuel with sulfur content of 500 mg/kg

4.1.6.8 Test Method **D6750**, the 1N diesel engine test, has been used to predict piston deposit formation in four-stroke cycle, direct injection, diesel engines that have been calibrated to meet 1994 U.S. federal exhaust emissions requirements for heavy-duty engines operated on fuel containing sulfur content of 500 mg/kg.

4.1.6.9 Test Method **D5966**, the roller follower wear test (RFWT), has been correlated with hydraulic roller cam follower pin wear in medium-duty indirect injection diesel engines used in broadly based field operations.

<sup>16</sup> Supporting data have been filed at ASTM International Headquarters and may be obtained by requesting Research Report RR:D02-1321. Contact ASTM Customer Service at service@astm.org.

4.1.6.10 Test Method **D6896** (MRV TP-1) has been shown to predict field failures resulting from poor low temperature pumpability of used engine oils.

4.1.6.11 Test Method **D7109**, a diesel injector shear test, has been shown to correlate with permanent shear loss of engine oils in medium-duty direct injection diesel engines used in broadly based field operations.

4.1.6.12 Test Method **D6594** operated at 135 °C, a high temperature corrosion bench test (HTCBT), has been shown to predict corrosion of engine oil-lubricated copper and lead containing components used in diesel engines.

4.1.6.13 Test Methods **D4741**, **D4683**, and **D5481** High Temperature High Shear (HTHS) tests are part of the SAE J300 Viscosity Classification System.

4.1.6.14 Test Method **D892**, a foaming test, Sequences I, II, and III, has been shown to predict foaming of engine oils in diesel engines.

4.1.6.15 Test Method **D7216**, the Elastomer Compatibility Test, is used to measure the performance of four widely used elastomer compounds when exposed to diesel engine oils.

4.1.6.16 Licensing of the API CK-4 or FA-4 category by the American Petroleum Institute (API) requires that candidate oils meet the performance requirements in this specification, and that the oils be tested in accordance with the protocols described in the ACC Petroleum Additives Product Approval Code of Practice. The methodology detailed in the ACC Code will help ensure that an engine oil meets its intended performance specification. (See **Appendix X3** for more information.)

## 5. Performance Requirements

5.1 The oils identified by the categories discussed in Section 4 shall conform to the requirements listed in **Tables 1-6**.

NOTE 3—API has developed a symbol that can be licensed for use on containers of oils that conform to the requirements of one or more categories that are currently of commercial importance. API 1509 describes the symbol and licensing procedure.

NOTE 4—In practice, engine oils are often labeled with service category designations having some combination of both S and C prefixes.

NOTE 5—Intended service applications for the various categories described in 4.1.1 – 4.1.3 can be found in API 1509. Several applicable sections of that publication have been included in **Appendix X2**.

## 6. Test Procedures

6.1 The requirements listed in this specification shall be determined in accordance with those standard test methods listed in Section 2.

6.2 Engine tests are run in test stands calibrated using reference oils.

6.3 For tests monitored by the TMC, results are valid only if the tests are run in currently calibrated stands/equipment.

6.4 For SJ test results to be valid from the following test types, they shall have been conducted in stands/equipment in current calibration by the TMC: Test Methods **D5119**, **D5133**, **D5480**, **D5800**, **D6082**, **D6335**, **D6417**, **D6794**, **D6795**, **D6891**, **D6984**, and **D7320**.

6.5 For SL test results to be valid from the following test types, they shall have been conducted in stands/equipment in current calibration by the TMC: Test Methods **D5133**, **D5800**, **D6082**, **D6417**, **D6557**, **D6593**, **D6709**, **D6794**, **D6795**, **D6891**, **D6984**, **D7097**, and **D7320**.<sup>17</sup>

6.6 For CH-4 test results to be valid from the following test types, they shall have been conducted in stands/equipment in current calibration by the TMC: Test Methods **D5800**, **D5966**, **D5967** (extended), **D6417**, **D6483**, **D6594**, **D6681**, **D6750**, **D6838**, **D6894**, **D6984**, **D6987/D6987M**, **D7320**, and **D7468**.

6.7 For CI-4 test results to be valid from the following test types, they shall have been conducted in stands/equipment in current calibration by the TMC: Test Methods **D5800**, **D5966**, **D5967** (extended), **D6594**, **D6750**, **D6923**, **D6894**, **D6975**, **D6984**, **D6987/D6987M**, **D7320**, and **D7468**.

6.8 For CJ-4 test results to be valid from the following test types, they shall have been conducted in stands/equipment in current calibration by the TMC: Test Methods **D874**, **D5800**, **D5966**, **D6594**, **D6750**, **D6894**, **D6984**, **D7156**, **D7216**, **D7320**, **D7422**, **D7468**, **D7484**, and **D7549**.

6.9 For CK-4 or FA-4 test results to be valid from the following test types, they shall have been conducted in stands/equipment in current calibration by the TMC: Test Methods **D874**, **D5800**, **D5966**, **D6594**, **D6750**, **D7156**, **D7216**, **D7422**, **D7468**, **D7484**, **D7549**, **D8047**, and **D8048**.

## 7. Keywords

7.1 automotive; engine oil; engine oil categories; engine oil test methods; heavy-duty engine; internal combustion engine; light duty engine

<sup>17</sup> Effective October 1, 2000. If calibrated bench test equipment is unavailable, tests may be conducted in uncalibrated equipment. However, when calibrated equipment does become available, tests shall be passed in calibrated equipment within six months.

**TABLE 2 Diesel Engine Oil Category CH-4**

Required Test Method	Test Method	Rated or Measured Parameter	Primary Performance Criteria		
			One-test	Two-test <sup>A</sup>	Three-test <sup>A</sup>
1P (D6681 <sup>B</sup> )	D6681	Weighted demerits (WDP), max	350	378	390
		Top groove carbon (TGC), demerits, max	36	39	41
		Top land carbon (TLC), demerits, max	40	46	49
		Average Oil Consumption, g/h (0 h – 360 h), max	12.4	12.4	12.4
		Final Oil Consumption, g/h (312 h – 360 h), max	14.6	14.6	14.6
		Piston, ring, and liner scuffing	none	none	none <sup>C</sup>
1K (D6750 <sup>D</sup> )	D6750	Weighted demerits (WDK), %, max	332	347	353
		Top groove fill (TGF), %, max	24	27	29
		Top land heavy carbon (TLHC), %, max	4	5	5
		Average Oil Consumption, g/kWh (0 h – 252 h), max	0.54	0.54	0.54
		g/MJ (0 h – 252 h), max	0.15	0.15	0.15
		Piston, ring, and liner scuffing	none	none	none <sup>C</sup>
T-9 (D6483) or T-10 (D6987/D6987M) or T-12 (D7422)	D6483	Average Liner Wear, normalized to 1.75 % soot, µm max	25.4	26.6	27.1
		Average Top Ring Mass Loss, mg max <sup>E</sup>	120	136	144
		EOT Used Oil Lead Content less New Oil Lead Content, mg/kg, max	25	32	36
	D6987/D6987M	Liner wear, µm, max	32	34	35
		Ring wear, mg, max	150	159	163
		Lead content at EOT, mg/kg, max	50	56	59
	D7422	Liner wear, µm, max	30.0	30.8	31.1
		Top Ring Mass Loss, mg, max	120	132	137
		Lead content at EOT, mg/kg, max	65	75	79
RFWT (D5966)	D5966	Average Pin Wear			
		mils, max (µm) max	0.30 (7.6)	0.33 (8.4)	0.36 (9.1)
M11 (D6838 <sup>F</sup> ) or ISM (D7468)	D6838	Rocker Pad Average Mass Loss, normalized to 4.5 % soot, mg max	6.5	7.5	8.0
		Oil Filter Differential Pressure at EOT, kPa max	79	93	100
		Average Engine Sludge, CRC Merits at EOT, min	8.7	8.6	8.5
	D7468	Crosshead wear, mg, max	7.5	7.8	7.9
		Oil filter delta pressure, at 150 h, kPa, max	79	95	103
		Sludge rating, CRC merits, min	8.1	8.0	8.0
Ext. T-8E (D5967 <sup>G</sup> )	D5967	Relative Viscosity at 4.8 % Soot by TGA, max	2.1	2.2	2.3
		Viscosity increase at 3.8 % Soot by TGA, mm <sup>2</sup> /s, max	11.5	12.5	13.0
Sequence IIIF (D6984)	D6984	60 h Viscosity at 40 °C, increase from 10 min sample, % max	295	295 (MTAC) <sup>H</sup>	295 (MTAC) <sup>H</sup>
or Sequence IIIG (D7320 <sup>I</sup> )	D7320	Kinematic viscosity, % increase at 40 °C max	150	150 (MTAC)	150 (MTAC)
or Sequence IIH (D8111)	D8111	60 h Kinematic viscosity, % increase at 40 °C max	110	110 (MTAC)	110 (MTAC)
EOAT (D6894 <sup>J</sup> )	D6894	Aeration, volume, % max	8.0	8.0 (MTAC) <sup>H</sup>	8.0 (MTAC) <sup>H</sup>
HTCBT, 135 °C (D6594)	D6594	Used Oil Elemental Concentration	N/A	N/A	N/A
		Copper, mg/kg increase, max	20	N/A	N/A
		Lead, mg/kg increase, max		120	
		Tin, mg/kg increase		report	
		Copper strip rating, <sup>K</sup> max		3	
		Foaming/Settling, <sup>L</sup> mL, max			
D892 (Option A not allowed)	D892 (Option A not allowed)	Sequence I	10/0	N/A	N/A
		Sequence II	20/0	N/A	N/A
		Sequence III	10/0	N/A	N/A
			SAE 10W-30	SAE 15W-40	N/A
Noack (D5800)					
or D6417	D5800	percent volatility loss at 250 °C, max	20	18	N/A
	D6417	percent volatility loss at 371 °C, max	17	15	N/A
D6278	D6278	Kinematic Viscosity after shearing, mm <sup>2</sup> /s, min	SAE XW-30 9.3	SAE XW-40 12.5	N/A N/A

<sup>A</sup> See Annex A2 for additional information.

<sup>B</sup> Refer to RR:D02-1441.

<sup>C</sup> If three or more operationally valid tests have been run, the majority of these tests shall not have scuffing. The scuffed tests are considered uninterpretable, and all data from these tests are eliminated from averaging.

<sup>D</sup> Refer to RR:D02-1273.

<sup>E</sup> Refer to RR:D02-1440.

<sup>F</sup> Refer to RR:D02-1439.

<sup>G</sup> A passing T-11 (TGA % soot at 12.0 mm<sup>2</sup>/s increase, at 100 °C, min)—6.00 (first test), 5.89 (second test), and 5.85 (third test)—can be used in place of a T-8E in the applicable categories. This is not intended to indicate equivalence.

<sup>H</sup> See Annex A1; use method without transformations.

<sup>I</sup> The Sequence IIIG limits shown are more restrictive than the corresponding limits in Sequence IIIF, and are not intended to indicate equivalence. Results meeting the Sequence IIIG criteria stated can be used in lieu of Sequence IIIF.

<sup>J</sup> Refer to RR:D02-1379.

<sup>K</sup> The rating system in Test Method D130 is used to rate the copper coupon in Test Method D6594.

<sup>L</sup> Ten minutes for Sequence I, II, and III.

**TABLE 3 Diesel Engine Oil Category CI-4**

Required Test Method	Engine Test Method	Rated or Measured Parameter	Primary Performance Criteria		
1R (D6923) or 1P (D6681)	D6923	Weighted demerits (WDR), max	382	396	402
		Top groove carbon (TGC), demerits, max	52	57	59
		Top land carbon (TLC), demerits, max	31	35	36
		Initial oil consumption (IOC), (0 h – 252 h), g/h, average	13.1	13.1	13.1
		Final oil consumption,(432 h – 504 h), g/h, average, max	IOC + 1.8	IOC + 1.8	IOC + 1.8

CI-4 Bench Tests		Measured Parameter	Primary Performance Criteria		
D4683 (High temperature/High shear) or D4741 or D5481 <sup>J</sup>		Viscosity after shear, <sup>K</sup> min	3.5 mPa-s		
The following limits are applied to SAE viscosity grades 0W, 5W, 10W, and 15W:					
MRV-TP-1 (D4684)	Viscosity of 75 h used oil sample from T-10 test (or T-10A <sup>L</sup> test), or 100 h used oil sample from T-12 test (or T-12A <sup>M</sup> test, tested at –20 °C, mPa-s, max		25 000		
	If yield stress is detected, use modified D4684 <sup>N</sup> (external preheat), then mPa-s, max		25 000		
Noack (D5800)	and yield stress, Pa		<35		
	Evaporative loss at 250 °C, %, max		15		
135 °C HTCBT (D6594)	Copper, mg/kg increase, max		20		
	Lead, mg/kg increase, max		120		
	Tin, mg/kg increase		report		
D6278	Copper strip rating, <sup>O</sup> max		3		
	Kinematic viscosity after shearing mm <sup>2</sup> /s, min		SAE XW-30	SAE XW-40	
	Foaming/settling, <sup>P</sup> mL, max		9.3	12.5	
D892 (Option A not allowed)			Primary Performance Criteria		
	Sequence I		10/0		
	Sequence II		20/0		
	Sequence III		10/0		
D7216 (Elastomer Compatibility)					

Note—These are the *unadjusted specification limits* for elastomer compatibility. Candidate oils shall, however, conform to the *adjusted specification limits*, the calculation of which is described in **Annex A4**.

Elastomer	Volume Change, %	Hardness Change, Points	Tensile Strength Change, %	Elongation at Break Change, %
Nitrile (NBR)	(+5, -3)	(+7, -5)	(+10, -TMC 1006)	(+10, -TMC 1006)
Silicone (VMQ)	(+TMC 1006, -3)	(+5, -TMC 1006)	(+10, -45)	(+20, -30)
Polyacrylate (ACM)	(+5, -3)	(+8, -5)	(+18, -15)	(+10, -35)
Fluoroelastomer (FKM)	(+5, -2)	(+7, -5)	(+10, -TMC 1006)	(+10, -TMC 1006)

**TABLE 3** *Continued*
**D7216** (Elastomer Compatibility)

Note—TMC 1006 is the designation for the reference oil used in this test method. This designation represents the original blend or subsequent approved re-blends of TMC 1006.

<sup>A</sup> See **Annex A6** for additional information.

<sup>B</sup> A passing T-11 (TGA % soot at 12.0 mm<sup>2</sup>/s increase, at 100 °C, min)—6.00 (first test), 5.89 (second test), and 5.85 (third test)—can be used in place of a T-8E in the applicable categories. This is not intended to indicate equivalence.

<sup>C</sup> Relative Viscosity (RV) = viscosity at 4.8 % soot/viscosity of new oil sheared in Test Method **D6278**.

<sup>D</sup> Refer to RR:D02-1391.

<sup>E</sup> The Sequence IIIG limits shown are more restrictive than the corresponding limits in Sequence IIIF, and are not intended to indicate equivalence. Results meeting the Sequence IIIG criteria stated can be used in lieu of Sequence IIIF.

<sup>F</sup> 70 h value is interpolated according to the equation  $PVIS@70\text{ h} = \left( \frac{\sqrt{PVIS@60\text{ h}} + \sqrt{PVIS@80\text{ h}}}{2} \right)^2$ , where PVIS@60 h is percent viscosity increase at 60 h and PVIS@80 h is percent viscosity increase at 80 h.

<sup>G</sup> Refer to RR:D02-1273. Alternatively, Test Method **D6750** (1N) can be used; if this test method is used, the measured parameters and primary performance criteria are the same as those shown for Test Method **D6750** (1N) in the CJ-4 category.

<sup>H</sup> Refer to RR:D02-1379.

<sup>I</sup> See **Annex A1**; use method without transformations.

<sup>J</sup> Tests as allowed in SAE J300.

<sup>K</sup> Noncritical specification as defined by Practice **D3244**; may be superseded only by applicable higher limits set by SAE J300.

<sup>L</sup> The T-10A test is the name given to a T-10 test run for 75 h to generate the sample for measurement by Test Method **D4684**.

<sup>M</sup> The T-12A test is the name given to a T-12 test run for 100 h to generate the sample for measurement by Test Method **D4684**.

<sup>N</sup> Refer to RR:D02-1517.

<sup>O</sup> The rating system in Test Method **D130** is used to rate the copper coupon in Test Method **D6594**.

<sup>P</sup> Ten minutes for Sequence I, II, and III.

**TABLE 4 Diesel Engine Oil Category CJ-4**

Required Test Method	Engine Test Method	Rated or Measured Parameter		Primary Performance Criteria		
				One-test	Two-test	Three-test
T-12 (D7422)	D7422	Merit rating, <sup>A</sup> min		1000	1000	1000

## ANNEXES

### (Mandatory Information)

#### A1. MULTIPLE TEST ACCEPTANCE CRITERIA

A1.1 Multiple Test Acceptance Criteria (MTAC) is any data-based approach for evaluation of the quality and performance of a formulation where more than one test may be run. Generally for a candidate tested once, test data for each criterion shall be a pass. For a candidate tested twice, the mean (average) value of each result shall be a pass. For a candidate tested three or more times, one test might be declared an outlier and thus discarded and the mean (average) value of retained test data for each result shall be a pass. Data are rounded in accordance with the procedures specified in Practice E29.

A1.1.1 For light-duty categories, SJ, SL, and the Energy Conserving categories, and the Sequence IIIF, Sequence IIIG, and EOAT tests as used in CH-4, CI-4 and CJ-4, the only requirement for declaring an outlier is that three or more tests

have been run. Generally, light-duty pass criteria are constant regardless of the number of tests run. The results for which MTAC apply and appropriate transformations are shown in Table A1.1.

A1.1.2 For heavy-duty categories and most CH-4, CI-4, CJ-4, CK-4, and FA-4 parameters, outlier criteria are specified in the following annexes, and tiered, constant, or other pass criteria are shown in Tables 2-6.

A1.2 The following process shall be used to calculate the MTAC mean of test results for a formulation with two or more operationally valid test results (unless otherwise specified).

A1.2.1 Obtain severity adjusted (if applicable) test results for engine test of interest.

**TABLE A1.1 Parameters to Be Transformed and Averaged in Determination of MTAC**

Test Method	Rated Parameter	Transformation
D5844 (Sequence IID)	Average engine rust	NA <sup>A</sup>
D5533 (Sequence IIIE)	Viscosity increase <sup>B</sup> (h to 375 %)	NA
	Average engine sludge	–LN (10-AES)
	Average piston varnish	NA
	Oil ring land deposits	NA
	Average camshaft plus lifter wear <sup>C</sup>	LN (ACLW)
	Maximum camshaft plus lifter wear <sup>C</sup>	LN (MCLW)
	Oil-related ring sticking	NA
D6984 (Sequence IIIF - as used in CH-4)	Percent viscosity increase at 60 h	LN
D6894 (EOAT)	Aeration, volume %	NA
D6984 (Sequence IIIF)	Viscosity, % increase	1/square root of the % viscosity increase at 80 h
	Average piston varnish	NA
	Weighed piston deposits	NA
	Screened average camshaft plus lifter wear	NA
	Hot stuck rings	NA
	Oil Consumption	NA
D7320 (Sequence IIIG)	Viscosity, % increase	LN
D6891 (Sequence IVA)	Cam wear	NA
D5302 (Sequence VE)	Average engine sludge	–LN (9.65 – AES)
	Rocker cover sludge	–LN (9.65 – RCS)
	Average piston varnish	NA
	Average engine varnish	NA
	Average camshaft wear	Square root of ACW
	Maximum camshaft wear	NA
	Oil screen clogging	NA
	Ring sticking	NA
D6593 (Sequence VG)	Average engine sludge	NA
	Rocker arm cover sludge	NA
	Average piston skirt varnish	NA
	Average engine varnish	NA
	Oil screen clogging	LN (Oil screen clogging + 1)
	Hot stuck compression rings	NA
D6202 (Sequence VIA)	Fuel economy improvement	NA
D6837 (Sequence VIB)	Fuel economy improvement	NA
D5119 (L-38)	Total bearing weight loss	NA
D6709 (Sequence VIII)	Total bearing weight loss	NA

<sup>A</sup> NA stands for Not Applicable.

<sup>B</sup> For tests reaching 375 % viscosity increase after 64 h, estimated hours = 64 + (6.163-LN (viscosity increase at 64 h + 100)/0.072). For tests reaching 375 % viscosity increase before 64 h, estimated hours are determined by a straight line interpolation between the two nearest 8 h points.

<sup>C</sup> When more than one test is run and if maximum wear is more than six times the average wear on any one test, the highest mating cam lobe/lifter result can be discarded and the remaining eleven combinations used to calculate a new maximum and average wear. This can only be done for one retained test.

A1.2.2 Transform each test result for each criterion in accordance with the transformed unit of measure in **Table A1.1**. Round each transformed test result to seven decimal places.

A1.2.3 Calculate the mean (arithmetic average) of the test results or transformed test results for each test criterion.

A1.2.4 Transform back, if applicable, each calculated criterion mean to its original units.

A1.2.5 Round each criterion mean, now in original units, to the same number of decimal places as in the applicable criterion pass limit.

A1.2.6 Compare each round criterion mean to its applicable pass limit to determine if performance criteria have been met.

## A2. CH-4 MULTIPLE-TEST PROGRAMS

A2.1 For the CH-4 test parameters on which outlier criteria apply (as shown in **Table A2.1**), if three or more tests are run, one complete test can be discarded if the outlier criteria defined in Practice **E178** are met at a significance level of 5 %. Since the criteria are based upon the number of tests in the program, each program is unique.

A2.2 Section 6 (Recommended Criteria for Known Standard Deviations) of Practice **E178** is used to determine outliers. The standard deviation applied in the outlier determination for each parameter is shown in **Table A2.1**.

**TABLE A2.1 Outlier Test Determination Values**

Test Parameter	Estimate of Standard Deviation
1P-WDP	57.6 <sup>A</sup>
1P-TGC	7.74 <sup>A</sup>

M11 EGR – CWL (corrected to 4.6 % average soot)	3.7 (after transform)
M11 EGR – OFDP	2.7000 square root transform
M11 EGR – Sludge	0.38
ISM – Crosshead wear	0.6
ISM – OFDP	0.4227 Ln transform
ISM – Sludge	0.2
RFWT – APW	0.04
T-8E – Viscosity <sub>rel</sub> at 4.8 % soot <sup>A</sup>	0.27
T-10 – Liner Wear	3.4
T-10 – TRWL	26
T-10 – EOT Lead	7.1
T-10 – 250-300 Lead	5.2
T-10 – AOC	10.9

<sup>A</sup> 100 % of Test Method **D6278** viscosity delta used in relative viscosity calculation.

A3.2 Section 6 (Recommended Criteria for Known Standard Deviations) of Practice **E178** is used to determine outliers. The standard deviation applied in the outlier determination for each parameter is shown in **Table A3.1**.

A3.3 Application of the Mack T-10 or, alternatively, the T-12 (T-10) Merit Rating Systems to single and multiple test results follows the guidelines shown in **A3.4.1 – A3.4.7**. The T-12(T-10) Merit Rating System is based on results obtained in Test Method **D7422**, the T-12 test method, but with rating values specified that approximate those established for the T-10 test method. The Mack T-10 and T-12 Rating System calculation methodology is described in the respective test methods.

A3.4 **Tables A3.2 and A3.3** each contain *Maximum*, *Anchor*, and *Minimum* values, as well as *Weight* values, for the specified tests and the test parameters.

A3.4.1 If all of the test parameter results from a given test method are equal to or better than the *Anchor* values shown in the corresponding table, this is a passing merits result.

A3.4.2 If all of the test parameter results from a given test method exactly meet the *Anchor* values in the corresponding table, each test result receives merits equal to the *Weight* values and the total merit rating of 1000 is a passing merits result.

A3.4.3 If any of the test parameter results from a given test method are at the *Maximum* values shown in the corresponding table, zero merit points are earned for that parameter.

A3.4.4 If any of the test parameter results from a given test method are worse than the *Maximum* values shown in the corresponding table, this is a failing result.

A3.4.5 If results for all of the test parameters from a given test method are better than the corresponding *Maximum* values, but one or more results is worse than the corresponding *Anchor* values, the appropriate Merit Rating System applies a mathematical calculation methodology to determine whether marginal results worse than the *Anchor* values are compensated by better than *Anchor* values on other test parameters.

**TABLE A3.2 Mack T-10 Merit System**

Criterion	(0 h – 300 h) Delta Lead, mg/kg	(250 h – 300 h) Delta Lead, mg/kg	Cylinder Liner Wear, $\mu$ m	Top Ring Mass Loss, mg	Oil Consumption, g/h
Weight (Total = 1000)	225	225	250	150	150
Maximum	35	14	32.0	158	65.0
Anchor	30	10	30	140	57
Minimum	5	0	12	50	25

**TABLE A3.3 Alternative Mack T-12(T-10) Merit System**

Criterion	(0 h –300) h Delta Lead, mg/kg	(250 h –300) h Delta Lead, mg/kg	Cylinder Liner Wear, $\mu\text{m}$	Top Ring Mass Loss, mg	Oil Consumption, g/h
Weight (Total = 1000)	200	200	250	200	150
Maximum	42	18	26	117	95
Anchor	35	13	23	82	82
Minimum	10	0	12	47	50

A3.4.6 If any of the test parameters from a given test method are at or better than the *Minimum* values shown in the corresponding table, merit points are received equal to twice the *Weight* values in the corresponding table for that parameter.

A3.4.7 Multiple test evaluation for a given test method consists of averaging the individual test parameter results

across multiple tests. The T-10 or, alternatively, T-12(T-10) Merit Rating Systems are then applied to the averages of the test parameter results. (See [Appendix X7](#) for the detailed T-12/T-10 calculation methodology.)

## A4. PROCEDURE FOR DERIVING ADJUSTED SPECIFICATION LIMITS FOR ELASTOMER COMPATIBILITY

### A4.1 Background

A4.1.1 This annex describes a statistical method to account for the inherent test variability in the elastomer compatibility test method. The need to take account of the inherent test variability arises in part because batch-to-batch, sheet-to-sheet and within-sheet variations in the properties of the reference elastomers (the four elastomers listed for the CI-4 category in [Table 3](#)) can be sufficiently large that they complicate making a decision as to whether or not a candidate oil has passed the elastomer compatibility requirements.

A4.1.2 Applying this statistical method to the unadjusted specification limits noted in [Tables 2-6](#) produces the adjusted specification limits. *Passing* candidate-oil results shall lie within the range defined by the adjusted specification limits.

A4.1.3 The statistical method for determining the adjusted specification limits uses updated information about the industry test variability relevant to the time frame in which the candidate oil is tested. The TMC provides the updated information based on test results obtained by different test laboratories with different batches of reference elastomers on the same TMC 1006 reference oil.

### A4.2 Unadjusted Specification Limits

A4.2.1 The unadjusted specification limits are shown for the CI-4 category in [Table 3](#). (These are reproduced in [Table A4.1](#) for comparison purposes.) The test method involves sixteen criteria. These criteria are the unadjusted specified limits for the four elastomer types (nitrile, silicone, polyacrylate and fluoroelastomer), with changes in four properties (volume, hardness, tensile strength and elongation at break).

### A4.3 Adjusted Specification Limits

A4.3.1 The adjusted specification limits are calculated by adjusting the numerical limits in [Tables 2-6](#) (referred to as *fixed limits*), and the TMC 1006 limit in [Tables 2-6](#) (referred to as a

*variable limit*). The reference oil TMC 1006 is run in parallel with the candidate oil as a control for each experiment.

A4.3.2 The adjusted specification limits are determined as the unadjusted specification limits plus (in absolute terms) an amount to account for test variability.

### A4.4 Inherent Test Variability

A4.4.1 [Table A4.2](#) shows examples of the standard deviation estimates of the four reference elastomers and the four performance parameters, as reported by the TMC. The standard deviation estimates, applicable at the time a test oil is evaluated, are obtained from the TMC website ([ftp://ftp.astmtmc.cmu.edu/refdata/bench/elastomer\\_pc9/PC-9\\_Elastomer\\_1006.xls](ftp://ftp.astmtmc.cmu.edu/refdata/bench/elastomer_pc9/PC-9_Elastomer_1006.xls)).

### A4.5 Adjusted Specification Limits—Calculations

#### A4.5.1 Calculation of Fixed Limits:

A4.5.1.1 Calculate the standard error of the test-oil mean by dividing the appropriate *total standard deviation* estimate by the square root of the number of observations in the sample. The number of observations in the sample, in the absence of outliers, is six.

A4.5.1.2 Multiply the standard error of the test-oil mean by 2.0.

A4.5.1.3 Add or subtract the resulting number to or from the respective upper or lower unadjusted specification limits to obtain the *fixed* adjusted specification limit(s).

#### A4.5.2 Calculation of Variable Limits:

A4.5.2.1 Calculate the standard error of the test-oil mean by dividing the appropriate *within-lab standard deviation* estimate by the square root of the number of observations in the sample. The number of observations in the sample, in the absence of outliers, is six.

A4.5.2.2 Multiply the standard error of the test-oil mean by 2.8.

A4.5.2.3 Add or subtract the resulting number to or from the mean result obtained with TMC 1006 (run in parallel with the test oil) to obtain either the upper or lower *variable* adjusted specification limit.

A4.5.3 **Table A4.3** shows an example of the calculated adjusted specification limits.

## A4.6 Comparison of Unadjusted and Adjusted Specification Limits

A4.6.1 **Table A4.1** reproduces the unadjusted specification limits for comparison with the above adjusted specification limits.

**TABLE A4.1 Unadjusted Specification Limits for the Elastomer Test Method as Part of the CI-4 Engine Oil Category**

Elastomer	Volume Change, %	Hardness Change, Points	Tensile Strength Change, MPa	Elongation at Break Change, %
Nitrile (NBR)	(+5, -3)	(+7, -5)	(+10, -TMC 1006)	(+10, -TMC 1006)
Silicone (VMQ)	(+TMC 1006, -3)	(+5, -TMC 1006)	(+10, -45)	(+20, -30)
Polyacrylate (ACM)	(+5, -3)	(+8, -5)	(+18, -15)	(+10, -35)
Fluoroelastomer (FKM)	(+5, -2)	(+7, -5)	(+10, -TMC 1006)	(+10, -TMC 1006)

**TABLE A4.2 Example of Total and Within-Laboratory Standard Deviation Estimates for the Four Reference Elastomers<sup>A</sup>**

Elastomer		Volume Change	Hardness Change	Tensile Strength Change	Elongation at Break Change
Nitrile (NBR)	Total	0.91	1.84	7.67	7.66
Nitrile (NBR)	Within-Lab	0.91	1.51	7.44	7.66
Silicone (VMQ)	Total	2.33	2.59	5.40	9.98
Silicone (VMQ)	Within-Lab	2.30	1.57	5.37	9.97
Polyacrylate (ACM)	Total	0.83	1.92	10.19	11.20
Polyacrylate (ACM)	Within-Lab	0.81	1.90	10.17	11.11
Fluoroelastomer (FKM)	Total	0.16	2.40	5.59	10.48
Fluoroelastomer (FKM)	Within-Lab	0.13	1.82	5.27	8.44

<sup>A</sup> Applicable for the period March 1, 2004 to March 15, 2004, as reported on the TMC website.

**TABLE A4.3 An Example of Adjusted Specification Limits for the Four Reference Elastomers—Applicable for the Period March 1, 2004 to March 5, 2004<sup>A</sup>**

Elastomer	Volume Change, %	Hardness Change, Points	Tensile Strength Change, %	Elongation at Break Change, %
Nitrile (NBR)	(+5.7, -3.7)	(+8.5, -6.5)	(+16.3, -TMC 1006 - 8.5)	(+16.3, -TMC 1006 - 8.8)
Silicone (VMQ)	(+TMC 1006 + 2.6, -4.9)	(+7.1, -TMC 1006 -1.8)	(+14.4, -49.4)	(-28.1, -38.1)
Polyacrylate (ACM)	(+5.7, -3.7)	(+9.6, -6.6)	(+26.3, -23.3)	(+19.1, -44.1)
Fluoroelastomer (FKM)	(+5.1, -2.1)	(+9.0, -7.0)	(+14.6, -TMC 1006 - 6.0)	(+18.6, -TMC 1006 - 9.6)

<sup>A</sup> Based on unadjusted specification limits, standard deviation estimates shown in **Table A4.2**, and six observations in all cases.

## A5. CJ-4 MULTIPLE TEST PROGRAMS AND TEST METHOD **D7422** (T-12), **D7549** (C13), AND **D7468** (ISM) MERIT RATING SYSTEM APPLICATIONS

A5.1 For the CJ-4 test parameters on which outlier criteria apply (contained in **Table A5.1**), if three or more tests are run, one complete test can be discarded if the outlier criteria defined in Practice **E178** are met at a significance level of 5 %. Since the criteria are based upon the number of tests in the program, each program is unique.

A5.1.1 Section 6 (Recommended Criteria for Known Standard Deviations) of Practice **E178** is used to determine outliers. The standard deviation applied in the outlier determination for each parameter will be shown in **Table A5.1**.

A5.2 The T-12, C13 and ISM Merit Rating Systems calculation methodology is described in the corresponding test methods.

A5.3 **Tables A5.2-A5.4** each contain *Maximum*, *Anchor* and *Minimum* values, as well as *Weight* values, for the specified tests and the test parameters.

A5.4 Application of the T-12, C13, and ISM Merit Rating Systems to single and multiple test results follows the guidelines provided below:

**TABLE A5.1 Outlier Test Determination Values**

Test Parameter	Estimate of Standard Deviation
1N – WDN	27.1
1N – TGF	0.488165 ln(TGF+1) transform
1N – TLHC	0.9 Ln(TLHC + 1) transform
1N – AOC	0.045
RFWT – APW	0.04
T-11 Soot at 4.0 mm <sup>2</sup> /s viscosity increase	0.20
T-11 Soot at 12.0 mm <sup>2</sup> /s viscosity increase	0.50
T-11 Soot at 15.0 mm <sup>2</sup> /s viscosity increase	0.61
ISB Cam Lobe Wear, μm, avg	5.0
ISB Slider tappet mass loss, mg, avg	14.8

**TABLE A5.2 Mack T-12 Merit System**

	Cylinder Liner Wear, μm	Top Ring Mass Loss, mg	Delta Lead, Final mg/kg	Delta Lead, (250 – 300) h mg/kg	Oil Consumption, g/h
Weight (Total = 1000)	250	200	200	200	150
Maximum	24.0	105	35	15	85.0
Anchor	20.0	70	25	10	65.0
Minimum	12.0	35	10	0	50.0

**TABLE A5.4 Cummins ISM Merit System**

	Crosshead Mass Loss, avg mg	Delta Oil Filter Pressure, kPa	Engine Sludge, avg merits	Valve Adj. Screw Mass Loss, mg
Weight (Total = 1000)	350	150	150	350
Maximum	7.1	19	8.7	49
Anchor	5.7	13	9.0	27
Minimum	4.3	7	9.3	16

**TABLE A5.3 Caterpillar C13 Merit System**

	Delta Oil Consumption, g/h	Top Land Carbon, avg %	Top Groove Carbon, avg %	Second Ring Top Carbon, %
Weight (Total = 1000)	300	300	300	100
Maximum	31	35	53	33
Anchor	25	30	46	22
Minimum	10	15	30	5

A5.4.1 If all of the test parameter results from a given test method are equal to or better than the *Anchor* values shown in the corresponding table, this is a passing merits result.

A5.4.2 If all of the test parameter results from a given test method exactly meet the *Anchor* values in the corresponding table, each test result receives merits equal to the *Weight* values and the total merit rating of 1000 is a passing merits result.

A5.4.3 If any of the test parameter results from a given test method are at the *Maximum* values shown in the corresponding table, zero merit points are earned for that parameter.

A5.4.4 If any of the test parameter results from a given test method are worse than the *Maximum* values shown in the corresponding table, this is a failing result.

A5.4.5 If results for all of the test parameters from a given test method are better than the corresponding *Maximum* values, but one or more results is worse than the corresponding *Anchor* values, the appropriate Merit Rating System applies a mathematical calculation methodology to determine whether marginal results worse than the *Anchor* values are compensated by better than *Anchor* values on other test parameters.

A5.4.6 If any of the test parameters from a given test method are at or better than the *Minimum* values shown in the corresponding table, merit points are received equal to twice the *Weight* values in the corresponding table for that parameter.

A5.4.7 Multiple test evaluation for a given test method consists of averaging the individual test parameter results across multiple tests. The T-12, C13, and ISM Merit Rating Systems are then applied to the averages of the test parameter results.

## **A6. CK-4 or FA-4 MULTIPLE TEST PROGRAMS AND TEST METHOD **D7549** (C13) AND **D7468** (ISM) MERIT RATING SYSTEM APPLICATIONS**

A6.1 For the CK-4 or FA-4 test parameters on which outlier criteria apply (contained in **Table A6.1**), if three or more tests are run, one complete test can be discarded if the outlier criteria defined in Practice **E178** are met at a significance level of 5 %.

A6.1.1 Section 8 (Recommended Criteria for Known Standard Deviations) of Practice **E178** is used to determine outliers. The standard deviation applied in the outlier determination for each parameter is shown in **Table A6.1**.

A6.2 The C13 and ISM Merit Rating Systems calculation methodology is described in the corresponding test methods.

A6.3 **Table A5.3** and **Table A5.4** each contain Maximum, Anchor and Minimum values, as well as Weight values, for the specified tests and the test parameters.

A6.4 Application of the C13 and ISM Merit Rating Systems to single and multiple test results follows the guidelines provided below: (The T-12 Merit Rating System does not apply to the T-12 tests conducted as part of the CK-4 and FA-4 categories.)

A6.4.1 If all of the test parameter results from a given test method are equal to or better than the Anchor values shown in the corresponding table, this is a passing merits result.

A6.4.2 If all of the test parameter results from a given test method exactly meet the Anchor values in the corresponding table, each test result receives merits equal to the Weight values and the total merit rating of 1000 is a passing merits result.

A6.4.3 If any of the test parameter results from a given test method are at the Maximum values shown in the corresponding table, zero merit points are earned for that parameter.

A6.4.4 If any of the test parameter results from a given test method are worse than the Maximum values shown in the corresponding table, this is a failing result.

A6.4.5 If results for all of the test parameters from a given test method are better than the corresponding Maximum values, but one or more results is worse than the corresponding Anchor values, the appropriate Merit Rating System applies a mathematical calculation methodology to determine whether marginal results worse than the Anchor values are compensated by better than Anchor values on other test parameters

A6.4.6 If any of the test parameters from a given test method are at or better than the Minimum values shown in the corresponding table, merit points are received equal to twice the Weight values in the corresponding table for that parameter

A6.4.7 Multiple test evaluation for a given test method consists of averaging the individual test parameter results across multiple tests. The C13 and ISM Merit Rating Systems are then applied to the averages of the test parameter results.

A6.5 Multiple Test Acceptance Criteria (MTAC) is one of several data-based approaches for evaluation of the quality and performance of a formulation where more than one test is run. For a candidate tested once, test data for each criterion shall be a pass. For a candidate tested more than once, the average value of each result shall be a pass. Data are rounded in accordance with the procedures specified in Practice **E29**.

A6.5.1 For categories CK-4 and FA-4, **D8047** (COAT) Average Aeration (40 h to 50 h), use the process detailed in **A6.5.3** through **A6.5.3.3** to calculate the MTAC mean of test results for a formulation with two or more operationally valid test results (without the MTAC provision in **A1.1** to discard any valid test result).

A6.5.2 For categories CK-4 and FA-4, **D7422** (T-12) Top Ring Mass Loss, mg, and **D7422** (T-12) Cylinder Liner Wear,  $\mu\text{m}$ , use the process detailed in **A6.5.3** through **A6.5.3.3** to calculate the average of test results for a formulation with two or more operationally valid test results (without the MTAC provision in **A1.1** to discard any valid test result).

**TABLE A6.1 Outlier Test Determination Values**

Test Parameter	Estimate of Standard Deviation
T-13 IR Peak at EOT, Abs., $\text{cm}^{-1}$	11.0
T-13 Kinematic Viscosity Increase at 40 °C, %	1.21 square root (KV40) transform
T-11 Soot at 4.0 $\text{mm}^2/\text{s}$ , viscosity increase	0.20
T-11 Soot at 12.0 $\text{mm}^2/\text{s}$ , viscosity increase	0.50
T-11 Soot at 15.0 $\text{mm}^2/\text{s}$ , viscosity increase	0.61
ISB Slider tappet mass loss, mg, avg	14.8
ISB Cam Lobe Wear, $\mu\text{m}$ , avg	5.0
1N – WDN	27.1
1N – TGF	0.488165 $\ln(\text{TGF}+1)$ transform
1N – TLHC	0.9 $\ln(\text{TLHC}+1)$ transform
1N – AOC	0.045
RFWT– APW	0.04

A6.5.3 Obtain severity adjusted (if applicable) test results for relevant test method.

A6.5.3.1 Calculate the arithmetic average of the test results for each test criterion.

A6.5.3.2 Round each criterion average to the same number of decimal places as in the applicable criterion pass limit.

A6.5.3.3 Compare each rounded criterion average to its applicable pass limit to determine if performance criteria have been met.

## APPENDIXES

### (Nonmandatory Information)

#### X1. CLASSIFICATION MAINTENANCE

X1.1 Successful changes in minimum performance standards rely on close coordination among all affected parties. Technical societies, trade associations, original equipment manufacturers, oil and additive marketers, and consumers may perform different roles to define the need, develop the test methods, and establish oil performance limits.

X1.2 A new definition of oil performance can be requested by any individual, company, or association, including ILSAC, API, EMA, ILMA, ACC, any individual marketer, additive supplier, or original equipment manufacturer (OEM), the U. S. Army, or consumer.

X1.3 Appropriate organizations (detailed in API 1509, Appendix C) consider the request for a new definition of oil performance, and if a need is deemed to exist, test methods are

chosen, or developed if none are available or suitable.

X1.4 Oil performance pass/fail criteria are generally selected through technical society consensus procedures, and after appropriate balloting, a new minimum oil performance standard is established.

X1.5 Typically, API then ballots the new standard for inclusion in API 1509, and develops consumer language, the designation, and licensing requirements for the new engine oil category.

X1.6 For a comprehensive description of how new oil performance standards are developed, refer to API 1509, Appendix C.

#### X2. API DESCRIPTIONS

##### X2.1 SJ

X2.1.1 API Service Category SJ is to be adopted in 1996 for use in describing engine oil first mandated in 1997. This oil is for use in service typical of gasoline engines in current and earlier passenger car, van, and light truck operation under vehicle manufacturers' recommended maintenance procedures.

X2.1.2 Engine oils developed for this category provide performance exceeding the minimum requirements for API Service Category SH, which Service Category SJ is intended to replace. SJ has new requirements in the areas of volatility, water compatibility, foam inhibition, low temperature properties, high temperature deposit control, and phosphorus limits. All SJ oils must meet specified bench and engine tests.

X2.1.3 Engine oils that meet the API SJ designation have been tested in accordance with ACC Product Approval Code of Practice. These oils may use the API Base Oil Interchange Guidelines and the API Viscosity-Grade Read Across Guidelines, and may be used where API Service Category SH and earlier categories have been recommended.

##### X2.2 SL—2001 Gasoline Engine Warranty Maintenance Service

X2.2.1 API Service Category SL is for use in describing engine oils available in 2001. These oils are for use in service

typical of gasoline engines in current and earlier passenger car, sport utility vehicle, van, and light truck operations under vehicle manufacturers' recommended maintenance procedures.

X2.2.2 Engine oils that meet the API Service Category SL designation (see Appendix G of API Publication 1509) may be used where API Service Category SJ and earlier Categories have been recommended.

X2.2.3 Engine oils that meet the API Service Category SL designation have been tested in accordance with the ACC Code and may use the API Base Oil Interchangeability Guidelines and the API Guidelines for SAE Viscosity-Grade Engine Testing (see Appendixes E and F of API Publication 1509).

X2.2.4 Engine oils that meet these requirements may display API Service Category SL in the upper portion of the API Service Symbol.

##### X2.3 SM—2005 Gasoline Engine Warranty Maintenance Service

X2.3.1 API Service Category SM was adopted for use in describing engine oils available in 2004. These oils are for use in service typical of gasoline engines in current and earlier passenger cars, sport utility vehicles, vans, and light-duty trucks operating under vehicle manufacturers' recommended maintenance procedures.

X2.3.2 Engine oils that meet the API Service Category SM designation (see Appendix G of API Publication 1509) may be used where API Service Category SL and earlier S Categories have been recommended.

X2.3.3 Engine oils that meet the API Service Category SM designation have been tested in accordance with the ACC Code and may use the API Base Oil Interchangeability Guidelines and the API Guidelines for SAE Viscosity-Grade Engine Testing (see Appendices E and F of API Publication 1509).

X2.3.4 Starting November 30, 2004, oils that meet these requirements may display API Service Category SM in the upper portion of the API Service Symbol. Before the November 30, 2004, introduction date, oil marketers may license API SM oils as API SL.

## **X2.4 CH-4—1998 Diesel Engine Service**

X2.4.1 API Service Category CH-4 describes oils for use in those high-speed, four stroke-cycle diesel engines designed to meet 1998 exhaust emission standards as well as for previous model years. API CH-4 oils are specifically compounded for use with diesel fuels ranging in sulfur content up to 0.5 % by weight.

X2.4.2 These oils are especially effective to sustain engine durability even under adverse applications that may stress wear control, high-temperature stability, and soot handling properties. In addition, optimum protection is provided against nonferrous corrosion, oxidative and insolubles thickening, foaming, and viscosity loss due to shear. These oils also have the performance capability to afford a more flexible approach to oil drain intervals in accordance with the recommendations of the individual engine builders for their specific engines.

## **X2.5 CI-4—For 2004 Severe Duty Diesel Engine Service**

X2.5.1 API Service Category CI-4 describes oils for use in high-speed, four-stroke cycle diesel engines designed to meet 2004 exhaust emission standards implemented in 2002. These oils are intended for use in all applications with diesel fuels ranging in sulfur content up to 0.5 % weight.

X2.5.2 These oils are specifically formulated to sustain engine durability where Exhaust Gas Recirculation (EGR) is used and the impact of these oils on other supplemental exhaust emission devices has not been determined. Optimum protection is provided against corrosive and soot-related wear tendencies, piston deposits, degradation of low- and high-temperature viscometric properties due to soot accumulation, oxidative thickening, loss of oil consumption control, foaming, degradation of seal materials, and viscosity loss due to shear.

X2.5.3 Engine oils that meet the API Service Category CI-4 designation have been tested in accordance with the ACC Code and may use the API Base Oil Interchangeability Guidelines and the API Guidelines for SAE Viscosity-Grade Engine Testing.

X2.5.4 CI-4 oils are superior in performance to those meeting API CH-4, and may be used in engines calling for that API Service Category.

X2.5.5 The first license date for CI-4 will be September 5, 2002.

X2.5.6 Effective January 15, 2002, marketers may license products meeting API CI-4 requirements as CH-4.

## **X2.6 CJ-4—2007 Diesel Engine Service**

X2.6.1 API Service Category CJ-4 describes oils for use in high-speed four-stroke cycle diesel engines designed to meet 2007 model year on-highway exhaust emission standards as well as for previous model years.

X2.6.2 These oils are compounded for use in all applications with diesel fuels ranging in sulfur content up to 500 ppm (0.05 % by weight). However, the use of these oils with greater than 15 ppm (0.0015 % by weight) sulfur fuel may impact aftertreatment system durability and/or oil drain interval.

X2.6.3 These oils are especially effective at sustaining emission control system durability where particulate filters and other advanced aftertreatment systems are used. Optimum protection is provided for control of catalyst poisoning, particulate filter blocking, engine wear, piston deposits, low- and high-temperature stability, soot handling properties, oxidative thickening, foaming, and viscosity loss due to shear.

X2.6.4 Engine oils that meet the API Service Category CJ-4 designation have been tested in accordance with the ACC Code and may use the API Base Oil Interchangeability Guidelines and the API Guidelines for SAE Viscosity-Grade Engine Testing.

X2.6.5 API CJ-4 oils exceed the performance criteria of API CI-4 with CI-4 PLUS, CI-4 and CH-4, and can effectively lubricate engines calling for those API Service Categories. When using CJ-4 oil with higher than 15 ppm sulfur fuel, consult the engine manufacturer for service interval.

X2.6.6 The first license date for API CJ-4 will be October 15, 2006.

X2.6.7 Effective May 1, 2006, marketers may license products meeting API CJ-4 requirements as API CI-4 with CI-4 PLUS, CI-4, and CH-4.

### X3. AMERICAN CHEMISTRY COUNCIL PETROLEUM ADDITIVES PANEL PRODUCT APPROVAL CODE OF PRACTICE

X3.1 Through the American Chemistry Council (ACC) Petroleum Additives Panel, the Product Approval Protocol Task Group developed the Product Approval Code of Practice for engine oil testing that was implemented in March 1992. Compliance with the Code of Practice is voluntary. The American Petroleum Institute (API) requires that all engine

tests conducted in support of API certification and licensing be conducted under the ACC Product Approval Code of Practice. More information is available from the ACC website:

<http://www.americanchemistry.com/paptg>

### X4. THE API SERVICE CATEGORY SM

X4.1 See [Table X4.1](#).

**TABLE X4.1 Requirements for API Service Category SM**

Engine Test Requirements <sup>A</sup>	Viscosity Grade Performance Requirements <sup>B</sup>	
	SAE 0W-20, SAE 5W-20, SAE 0W-30, SAE 5W-30, SAE 10W-30	All Others <sup>C</sup>
Sequence IIIG (ASTM <a href="#">D7320</a> )	Pass <sup>D</sup>	Pass
Sequence IIIGA	Pass	NR <sup>E</sup>
Sequence IVA (ASTM <a href="#">D6891</a> )	Pass	Pass
Sequence VG (ASTM <a href="#">D6593</a> )	Pass	Pass
Sequence VIII (ASTM <a href="#">D6709</a> )	Pass	Pass
Bench Test and Measured Parameter <sup>A</sup>	Viscosity Grade Performance Requirements <sup>B</sup>	
	SAE 0W-20, SAE 5W-20, SAE 0W-30, SAE 5W-30, SAE 10W-30	All Others <sup>C</sup>
ASTM <a href="#">D6557</a> (Ball Rust Test), avg gray value, min	100	100
ASTM <a href="#">D5800</a> , evaporation loss, 1 h at 250 °C, % max <sup>F</sup>	15	15
ASTM <a href="#">D6417</a> , simulated distillation at 371 °C, % max	10	10
ASTM <a href="#">D6795</a> , EOFT, percent flow reduction, max	50	50
ASTM <a href="#">D6794</a> , EOWTT, percent flow reduction, max		
with 0.6 % H <sub>2</sub> O	50	50
with 1.0 % H <sub>2</sub> O	50	50
with 2.0 % H <sub>2</sub> O	50	50
with 3.0 % H <sub>2</sub> O	50	50
ASTM <a href="#">D4951</a> , phosphorus percent mass, max <sup>G</sup>	0.08 <sup>H</sup>	NR
ASTM <a href="#">D4951</a> , phosphorus percent mass, min <sup>G</sup>	0.06 <sup>H</sup>	0.06 <sup>H</sup>
ASTM <a href="#">D4951</a> or <a href="#">D2622</a> , sulfur percent mass, max <sup>G</sup>		
SAE 0W-20, 0W-30, 5W-20, and 5W-30	0.5 <sup>H</sup>	NR
SAE 10W-30	0.7 <sup>H</sup>	NR
ASTM <a href="#">D892</a> (Option A), foaming tendency		
Sequence I, mL, max, tendency/stability <sup>I</sup>	10/0	10/0
Sequence II, mL, max, tendency/stability <sup>I</sup>	50/0	50/0
Sequence III, mL, max, tendency/stability <sup>I</sup>	10/0	10/0
ASTM <a href="#">D6082</a> (Option A), high-temperature foaming	100/0	100/0
mL, max, tendency/stability <sup>J</sup>		
ASTM <a href="#">D6922</a> , homogeneity and miscibility	K	K
ASTM <a href="#">D6709</a> , (Sequence VIII) shear stability	L	L
ASTM <a href="#">D7097</a> (TEOST MHT), high-temperature deposits,	35	45
deposit mass, mg, max <sup>G</sup>		
ASTM <a href="#">D5133</a> , gelation index, max	12 <sup>M</sup>	NR

<sup>A</sup> Tests are per ASTM requirements.

<sup>B</sup> All oils must meet the requirements of the most recent edition of SAE J300.

<sup>C</sup> Does not include SAE 0W-16 and SAE 5W-16.

<sup>D</sup> The “Pass” limits for the Sequence IIIG, IIIGA, IVA, VG and VIII are the engine sequence test limits published in the ILSAC GF-4 Passenger Car Engine Oil Minimum Performance Standard [Table Q-4 in Technical Bulletin 2 to the 15th edition of API 1509 (issued May 2, 2004)].

<sup>E</sup> NR = Not required.

<sup>F</sup> Calculated conversions specified in ASTM [D5800](#) are allowed.

<sup>G</sup> For all viscosity grades: If CF-4, CG-4, and/or CI-4 categories precede the “S” category and there is no API Certification Mark, the limits for phosphorus, sulfur, and the TEOST MHT do not apply. Note that these oils have been formulated primarily for diesel engines and may not provide all of the performance requirements consistent with vehicle manufacturers’ recommendations for gasoline-fueled engines.

<sup>H</sup> This is a non-critical specification as described in ASTM [D3244](#).

<sup>I</sup> After 10 min settling period.

<sup>J</sup> After 1 min settling period.

<sup>K</sup> Shall remain homogeneous and, when mixed with ASTM reference oils, shall remain miscible.

<sup>L</sup> Ten-hour stripped kinematic viscosity at 100 °C. Kinematic viscosity must remain in original viscosity grade.

<sup>M</sup> To be evaluated from –5 °C to temperature at which 40 000 cP is attained, or 2 °C below the appropriate MRV TP-1 temperature (defined by SAE J300), whichever occurs first.

## **X5. REQUIREMENTS FOR API SERVICE CATEGORY SN AND API SN WITH RESOURCE CONSERVING**

X5.1 See **Table X5.1**.

**TABLE X5.1 Requirements for API Service Category SN and API SN with Resource Conserving**

NOTE 1—All oils must meet the requirements of the most recent edition of SAE J300.

NOTE 2—NR = Not required.

All other viscosity grades	NR	NR	30
ASTM D7563, emulsion retention	NR	NR	no water separation
ASTM D7216, Annex A2, elastomer compatibility	Table G-6	Table G-6	Table G-6

<sup>A</sup> Resource Conserving does not apply to SAE 0W-16 and SAE 5W-16.

<sup>B</sup> Tests are per ASTM requirements.

<sup>C</sup> If CI-4 and/or CJ-4 categories precede the “S” category and there is no API Certification Mark, the Sequence VG (ASTM D6593), Ball Rust (ASTM D6557), and Gelation Index (ASTM D5133) tests are not required.

<sup>D</sup> Viscosity grades are limited to 0W, 5W and 10W multigrade oils.

<sup>E</sup> Not required for monograde and 15W, 20W, and 25W multigrade oils.

<sup>F</sup> Calculated conversions specified in ASTM D5800 are allowed.

<sup>G</sup> For all viscosity grades: If CH-4, CI-4 and/or CJ-4 categories precede the “S” category and there is no API Certification Mark, the “S” category limits for phosphorus, sulfur, and the TEOST MHT do not apply. However, the CJ-4 limits for phosphorus and sulfur do apply for CJ-4 oils. Note that these “C” category oils have been formulated primarily for diesel engines and may not provide all of the performance requirements consistent with vehicle manufacturers’ recommendations for gasoline-fueled engines.

<sup>H</sup> This is a non-critical specification as described in ASTM D3244.

<sup>I</sup> After 1 min settling period.

<sup>J</sup> After 10 min settling period.

<sup>K</sup> Shall remain homogenous and, when mixed with ASTM reference oils, shall remain miscible.

<sup>L</sup> Ten hour stripped kinematic viscosity at 100 °C. Kinematic viscosity must remain in original viscosity grade except XW-20, which must remain ≥5.6 mm<sup>2</sup>/s.

<sup>M</sup> To be evaluated from –5 °C to temperature at which 40 000 cP is attained or –40 °C, or 2 °C below the appropriate MRV TP-1 temperature (defined by SAE J300), whichever occurs first.

## **X6. ILSAC GF-5 STANDARD FOR PASSENGER CAR ENGINE OILS (EFFECTIVE OCTOBER 1, 2010)**

X6.1 The Japan Automobile Manufacturers Association, Inc. and representatives from Chrysler Group LLC, Ford Motor Company and General Motors LLC, through an organization called the International Lubricants Standardization and Approval Committee (ILSAC), jointly developed and approved an ILSAC GF-5 minimum performance standard for engine oils for spark-ignited internal combustion engines.

X6.2 This standard specifies the minimum performance requirements (both engine sequence and bench tests) and chemical and physical properties for engine oils for spark-ignited internal combustion engines. It is expected that many engine manufacturers will recommend ILSAC GF-5 oil. However, performance parameters other than those covered by the tests included or more stringent limits on those tests included in this standard may be required by individual OEMs.

X6.3 In addition to meeting the requirements of the standard, it is the oil marketer's responsibility to be aware of and comply with all applicable legal and regulatory requirements on substance use restrictions, labeling, and health and safety information when marketing products meeting the ILSAC GF-5 standard. It is also the marketer's responsibility to conduct its business in a manner that represents minimum risk to consumers and the environment.

X6.4 The ultimate assessment of an engine oil's performance must include a variety of vehicle fleet tests that simulate the full range of customer driving conditions. The engine sequence tests listed in this document have been specified instead of fleet testing to minimize testing time and costs. This simplification of test requirements is only possible because the specified engine sequence tests have been judged to be predictive of a variety of vehicle tests.

X6.5 The relationships between engine sequence tests and vehicle fleet tests are judged valid based only on the range of base oils and additive technologies investigated—generally those that have proven to have satisfactory performance in service and that are in widespread use at this time. The introduction of base oils or additive technologies that constitute a significant departure from existing practice requires sufficient supporting vehicle fleet testing data to ensure there is no adverse effect to vehicle components or to emission control systems. This vehicle fleet testing should be conducted in addition to the other performance requirements listed in this specification.

X6.6 It is the responsibility of any individual or organization introducing a new technology to perform this vehicle fleet testing, and the responsibility of the oil marketer to ensure the testing of new technology was satisfactorily completed. No marketer can claim to be acting in a reasonable and prudent manner if they knowingly use a new technology based only on the results of engine sequence testing without verifying the suitability of the new technology in vehicle fleet testing that simulates the full range of customer operation.

X6.7 The ILSAC GF-5 Minimum Performance Standard includes tests for which Viscosity Grade Read Across and Base Oil Interchange Guidelines have been developed by the appropriate groups. It should be pointed out, however, that when oil marketers use the guidelines, they do so based on their own judgment and at their own risk. The use of any guidelines does not absolve the marketer of the responsibility for meeting all specified requirements for any products the marketer sells in the marketplace that are licensed as ILSAC GF-5 with API. (See [Table X6.1](#).)

**TABLE X6.1 ILSAC GF-5 Passenger Car Engine Oil Standard<sup>A</sup>**

Requirement	Criterion
<b>Fresh Oil Viscosity Requirements</b>	
High temperature/high shear viscosity @ 150 °C, mPa-s SAE J300	ASTM <b>D4683</b> , <b>D4741</b> , <b>D5481</b> 2.6 (min) Oils shall meet all requirements of SAE J300. Viscosity grades are limited to SAE 0W, 5W, and 10W multigrade oils
Gelation index	ASTM <b>D5133</b> 12 (max) To be evaluated from –5 °C to temperature at which 40 000 cP is attained or –40 °C, or 2 °C below appropriate MRV TP-1 temperature (defined by SAE J300), whichever occurs first
<b>Engine Test Requirements</b>	
Wear and oil thickening	ASTM Sequence IIIG (ASTM <b>D7320</b> ) 150 (max)
Kinematic viscosity increase @ 40 °C, %	4.0 (min)
Average weighted piston deposits, merits	None
Hot stuck rings	60 (max)
Average cam plus lifter wear, µm	ASTM Sequence VG (ASTM <b>D6593</b> ) 8.0 (min)
Wear, sludge, and varnish	8.3 (min)
Average engine sludge, merits	8.9 (min)
Average rocker cover sludge, merits	7.5 (min)
Average engine varnish, merits	15 (max)
Average piston skirt varnish, merits	Rate and report
Oil screen sludge, % area	None
Oil screen debris, % area	Rate and report
Hot-stuck compression rings	ASTM Sequence IVA (ASTM <b>D6891</b> ) 90 (max)
Cold stuck rings	ASTM Sequence VIII (ASTM <b>D6709</b> ) 26 (max)
Oil ring clogging, % area	ASTM Sequence VID (ASTM <b>D7589</b> ) 2.6% min
Valvetrain wear	1.2% min after 100 h aging
Average cam wear (7 position avg), µm	1.9% min
Bearing corrosion	0.9% min after 100 h aging
Bearing weight loss, mg	1.5% min
Fuel efficiency	0.6% min after 100 h aging
SAE XW-20 viscosity grade	
FEI SUM	
FEI 2	
SAE XW-30 viscosity grade	
FEI SUM	
FEI 2	
SAE 10W-30 and all other viscosity grades not listed above	
FEI SUM	
FEI 2	
<b>Bench Test Requirements</b>	
Catalyst compatibility	
Phosphorus content, % (mass)	ASTM <b>D4951</b> 0.08 (max)
Phosphorus volatility (Sequence IIIGB, phosphorus retention)	ASTM <b>D7320</b> 79% (min)
Sulfur content	ASTM <b>D4951</b> or <b>D2622</b>
SAE 0W and 5W multigrades, % (mass)	0.5 (max)
SAE 10W-30, % (mass)	0.6 (max)
Wear	ASTM <b>D4951</b>
Phosphorus content, % (mass)	0.06 (min)
Volatility	ASTM <b>D5800</b>
Evaporation loss, %	15 (max), 1 h at 250 °C (Note: Calculated conversions specified in <b>D5800</b> are allowed.)
Simulated distillation, %	ASTM <b>D6417</b> 10 (max) at 371 °C TEOST MHT (ASTM <b>D7097</b> ) 35 (max)
High temperature deposits	TEOST 33C (ASTM <b>D6335</b> ) 30 (max)
Deposit weight, mg	Note: No TEOST 33C limit for SAE 0W-20.
High temperature deposits	ASTM <b>D6794</b>
Total deposit weight, mg	
Filterability	
EOWTT, %	50 (max) flow reduction
with 0.6% H <sub>2</sub> O	50 (max) flow reduction
with 1.0% H <sub>2</sub> O	50 (max) flow reduction
with 2.0% H <sub>2</sub> O	50 (max) flow reduction
with 3.0% H <sub>2</sub> O	Note: Test formulation with highest additive (DI/VI) concentration. Read across results to all other base oil/viscosity grade formulations using same or lower concentration of identical additive (DI/VI) combination. Each different DI/VI combination must be tested.
EOFT, %	ASTM <b>D6795</b> 50 (max) flow reduction
Fresh oil foaming characteristics	ASTM <b>D892</b> (Option A and excluding paragraph 11)
Tendency, mL	
Sequence I	10 (max)
Sequence II	50 (max)

**TABLE X6.1** *Continued*

Requirement	Criterion			
Sequence III	10 (max)			
Stability, mL, after 1 min settling				
Sequence I	0 (max)			
Sequence II	0 (max)			
Sequence III	0 (max)			
Fresh oil high temperature foaming characteristics	ASTM D6082 (Option A)			
Tendency, mL	100 (max)			
Stability, mL, after 1 min settling	0 (max)			
Aged oil low temperature viscosity	ROBO (ASTM D7528)			
Measure CCS viscosity of EOT ROBO sample at CCS temperature corresponding to original viscosity grade	a) If CCS viscosity measured is less than or equal to the maximum CCS viscosity specified for the original viscosity grade, run ASTM D4684 (MRV TP-1) at the MRV temperature specified in SAE J300 for the original viscosity grade. b) If CCS viscosity measured is higher than the maximum viscosity specified for the original viscosity grade in J300, run ASTM D4684 (MRV TP-1) at 5 °C higher temperature (i.e., at MRV temperature specified in SAE J300 for the next higher viscosity grade). EOT ROBO sample must show no yield stress in the D4684 test and its D4684 viscosity must be below the maximum specified in SAE J300 for the original viscosity grade or the next higher viscosity grade, depending on the CCS viscosity grade, as outlined in a) or b) above.			
Aged oil low temperature viscosity	or ASTM Sequence IIIGA (ASTM D7320) a) If CCS viscosity measured is less than or equal to the maximum CCS viscosity specified for the original viscosity grade, run ASTM D4684 (MRV TP-1) at the MRV temperature specified in SAE J300 for the original viscosity grade. b) If CCS viscosity measured is higher than the maximum viscosity specified for the original viscosity grade in J300, run ASTM D4684 (MRV TP-1) at 5 °C higher temperature (i.e., at MRV temperature specified in SAE J300 for the next higher viscosity grade). c) EOT IIIGA sample must show no yield stress in the D4684 test and its D4684 viscosity must be below the maximum specified in SAE J300 for the original viscosity grade or the next higher viscosity grade, depending on the CCS viscosity grade, as outlined in a) or b) above.			
Shear stability				
10 h stripped KV @ 100 °C	ASTM Sequence VIII (ASTM D6709) Kinematic viscosity must remain in original SAE viscosity grade, except XW-20, which must remain ≥5.6 mm <sup>2</sup> /s.			
Homogeneity and miscibility	ASTM D6922 Shall remain homogeneous and, when mixed with ASTM Test Monitoring Center (TMC) reference oils, shall remain miscible.			
Engine rusting				
Average gray value	Ball Rust Test (ASTM D6557) 100 (min)			
Emulsion retention	ASTM D7563			
0 °C, 24 h	No water separation			
25 °C, 24 h	No water separation			
Elastomer compatibility	ASTM D7216, Annex A2 Candidate oil testing for elastomer compatibility shall be performed using the five Standard Reference Elastomers (SREs) referenced herein and defined in SAE J2643. Candidate oil testing shall be performed according to ASTM D7216, Annex A2. The post-candidate-oil-immersion elastomers shall conform to the specification limits detailed below:			
Elastomer Material (SAE J2643)	Test Procedure	Material Property	Units	Limits
Polyacrylate Rubber (ACM-1)	ASTM D471	Volume	% Δ	-5, 9
	ASTM D2240	Hardness	pts.	-10, 10
	ASTM D412	Tensile Strength	% Δ	-40, 40
Hydrogenated Nitrile Rubber (HNBR-1)	ASTM D471	Volume	% Δ	-5, 10
	ASTM D2240	Hardness	pts.	-10, 5
	ASTM D412	Tensile Strength	% Δ	-20, 15
Silicone Rubber (VMQ-1)	ASTM D471	Volume	% Δ	-5, 40
	ASTM D2240	Hardness	pts.	-30, 10
	ASTM D412	Tensile Strength	% Δ	-50, 5
Fluorocarbon Rubber (FKM-1)	ASTM D471	Volume	% Δ	-2, 3
	ASTM D2240	Hardness	pts.	-6, 6
	ASTM D412	Tensile Strength	% Δ	-65, 10
Ethylene Acrylic Rubber (AEM-1)	ASTM D471	Volume	% Δ	-5, 30
	ASTM D2240	Hardness	pts.	-20, 10
	ASTM D412	Tensile Strength	% Δ	-30, 30

## X7. MACK T-10 MERIT CALCULATIONS USING MACK T-12 RESULTS

X7.1 Various oil specifications may use T-12 test results to obtain T-10 Mack Merits, using the calculation methodology shown in **X7.2 – X7.3**.

### X7.2 Merit System Components

X7.2.1 *Anchors*—Anchor performance level based on one test.

X7.2.2 *Maximums*—Limit of acceptable performance.

X7.2.3 *Minimums*—Limit of best performance.

X7.2.4 *Weights*—Relative contribution to total merit.

X7.2.5 *Multipliers*—Using **Table X7.1**, determine the multiplier for each parameter as follows:

X7.2.5.1 If a result is at the anchor, multiplier is one (for example, Liner Wear = 23 yields multiplier = 1).

X7.2.5.2 If a result is at or below the minimum, multiplier is two (for example, Liner Wear = 10 yields multiplier = 2).

X7.2.5.3 If a result is at the maximum, multiplier is zero (for example, Liner Wear = 26.0 yields multiplier = 0).

X7.2.5.4 If a result is between minimum and anchor, linearly interpolate multiplier between 2 and 1 (for example, Liner Wear = 14 yields multiplier = 1.82).

X7.2.5.5 If a result is between anchor and maximum, linearly interpolate multiplier between 1 and 0 (for example, Liner Wear = 25 yields multiplier = 0.33).

X7.2.5.6 If a result is above the maximum, linearly extrapolate multiplier on the same line as between 1 and 0 (for example, Liner Wear = 28.0 yields multiplier = -0.67).

X7.3 *Calculated Merit Result*—Sum the products of weights and multipliers across the five results. This is the calculated merit result. In equation form:

$$\text{Calculated Merit} = \sum_{i=1}^5 \text{Weight}_i \times \left\{ \begin{array}{l} \delta(\text{result}_i > \text{anchor}_i) \times (\text{max}_i - \text{result}_i) / (\text{max}_i - \text{anchor}_i) \\ + \delta(\text{min}_i < \text{result}_i \leq \text{anchor}_i) \times [1 + (\text{anchor}_i - \text{result}_i) / (\text{anchor}_i - \text{min}_i)] \\ + \delta(\text{result}_i \leq \text{min}_i) \times 2 \end{array} \right\}$$

where:

$\delta(x)$  = 1 if x is true; 0 if x is false.

**TABLE X7.1 Multipliers**

Criterion	0 h – 300 h Delta Pb	250 h – 300 h Delta Pb	Cylinder Liner Wear	Top Ring Weight Loss	Oil Consumption
Weight	200	200	250	200	150
Maximum	42	18	26.0	117	95.0
Anchor	35	13	23.0	82	82.0
Minimum	10	0	12.0	47	50.0

**X8. SH ENGINE OIL CATEGORY (RELEVANT INFORMATION IN COMBINATION WITH A “C” CATEGORY)**

X8.1 Report the results of the merit calculations on the appropriate form. (See **Table X8.1.**)

**TABLE X8.1 SH Engine Oil Category**

NOTE 1—(Relevant information in combination with a “C” category).

Engine Test Method	API SH Category Rated or Measured Parameter	Primary Performance Criteria	
D5844 <sup>A,B</sup> (Sequence IID)	Average engine rust rating, <sup>C</sup> min	8.5	
	Number stuck lifters	none	
or D6557 <sup>A</sup>	(Ball Rust Test) Average gray value, min	100

Test Method D5800 volatility loss, % max <sup>Q</sup>	25	20	18
Test Method D2887 volatility loss at 371 °C, % max <sup>Q</sup>	20	17	15
Test Method D6795 (EOFT), % flow reduction, max	50	50	NR <sup>R</sup>
Test Method D4951 or D5185, mass fraction phosphorus %, max	0.12	0.12	NR
Test Method D4951 or D5185, mass fraction phosphorus %, min	0.06	0.06	0.06
(all viscosity grades) (unless valid passing Test Method D5302 re- sults are obtained)			
Test Method D92 flash point, °C, min <sup>S</sup>	200	205	215
Test Method D93 flash point, °C, min <sup>S</sup>	185	190	200
Test Method D892 foaming tendency (Option A)			
Sequence I, max, foaming/settling <sup>T</sup>	10/0	10/0	10/0
Sequence II, max, foaming/settling <sup>T</sup>	50/0	50/0	50/0
Sequence III, max, foaming/settling <sup>T</sup>	10/0	10/0	10/0
Test Method D6082 (optional blending required)	report <sup>U</sup>	report <sup>U</sup>	report <sup>U</sup>
Test Method D6922 homogeneity and miscibility	v	v	v

<sup>A</sup> Demonstrate passing performance in either Test Method **D5844** or **D6557**.

<sup>B</sup> Monitoring of this test method was discontinued in June 20, 2001. Valid test results shall predate the end of the last calibration period for the test stand in which this test method was conducted.

<sup>C</sup> ASTM Deposit Rating Manual 20, available from ASTM Customer Relations, ASTM International, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959.

<sup>D</sup> Demonstrate passing performance in either Test Method **D5533** or **D6984**. However, an oil passing Test Method **D6984** and containing less than 0.08 % mass phosphorus in the form of ZDDP shall also pass the wear limits in Test Method **D5302** (see also footnote L).

<sup>E</sup> Determine at 60 h.

<sup>F</sup> Determine at 80 h.

<sup>G</sup> Determine weighted piston deposits by rating the following piston areas and applying the corresponding weightings: undercrown, 10 %; second land, 15 %; third land, 30 %; piston skirt, 10 %; first groove, 5 %; second groove, 10 %; and third groove, 20 %. Use ASTM Deposit Rating Manual 20 for all ratings.

- <sup>H</sup> Calculate by eliminating the highest and lowest cam-plus-lifter wear results and then calculating an average based on the remaining ten rating positions.
- <sup>I</sup> For oils containing at least 0.06 % mass phosphorus in the form of ZDDP, demonstrating passing performance in the Sequence IIIG test obviates the need to also conduct Test Method **D5302** (Sequence VE), which was previously required for oils with less than 0.08 % mass phosphorus.
- <sup>J</sup> Unlike the Sequence IIIF test, piston skirt varnish rating is not required in the Sequence IIIG test.
- <sup>K</sup> Demonstrate passing performance in Test Method **D5302**, or alternatively, in both Test Method **D6891** and Test Method **D6593**.
- <sup>L</sup> Determine cam wear according to Test Method **D6891**. Seven wear measurements are made on each cam lobe and the seven measured values are added to obtain an individual cam lobe wear result. The overall cam wear value is the average of the twelve individual cam lobe wear results.
- <sup>M</sup> Determine the average engine varnish rating by averaging the piston skirt, right rocker arm cover, and left rocker arm cover varnish ratings. Use ASTM Deposit Rating Manual 20 for all ratings.
- <sup>N</sup> Demonstrate passing performance in either Test Method **D5119** or **D6709**.
- <sup>O</sup> Ten-hour stripped kinematic viscosity (oil shall remain in original viscosity grade).
- <sup>P</sup> Passing bench test performance is only required for SAE 5W-30, SAE 10W-30, and SAE 15W-40 viscosity grades as defined in SAE J300.
- <sup>Q</sup> Meet either Test Method **D5800** or Test Method **D2887** volatility requirement.
- <sup>R</sup> NR stands for Not Required.
- <sup>S</sup> Meet either Test Method **D92** or Test Method **D93** flash point requirement.
- <sup>T</sup> Determine settling volume at 5 min.
- <sup>U</sup> Report kinetic foam volume (mL), static foam volume (mL), and collapse time, s.
- <sup>V</sup> Homogeneous with SAE reference oils.

## SUMMARY OF CHANGES

Subcommittee D02.B0 has identified the location of selected changes to this standard since the last issue (D4485 – 18) that may impact the use of this standard. (Approved Oct. 1, 2018.)

- (1) Revised **Table 2**, **Table 3**, and **Table 4** to add Test Method **D8111** guidelines for meeting this specification.
- (2) Added new subsection **3.2.4**.

Subcommittee D02.B0 has identified the location of selected changes to this standard since the last issue (D4485 – 16) that may impact the use of this standard. (Approved July 1, 2018.)

- (1) Former **Table 3** was revised to become individual tables **Tables 2-6**, and table references were updated throughout.
- (2) Deleted former subsections 4.1.7 through 4.1.9 and X2.7 through X2.8, Energy Conserving, associated with SJ and SL oil categories; required test methods are no longer available.
